DEATH **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Resident had slight/slow decline in health prior to vaccine but continued to be able to walk around with walker at community. The day of the vaccine she had a fever. 2 days after vaccine resident did not get out of bed all day and refused to eat. She had small amounts of orange juice as her blood sugar level was low due to not eating. Resident was diagnosed with a UTI and began an oral antibiotic. 3 days after and on day 5 after vaccine resident began feeling weak and had a fall on each day. The following day again resident spent the day in bed. The next day she was quite restless, was on the edge of her bed attempting to self transfer often throughout the day. Resident continued to be restless on the 10th of Feb, had further decline on the 11th of Feb. Resident passed away early the AM of Feb. 12th.

arthritis). Employee died on 2/9/2021. Unable to confirm a direct connection to Vaccine vs. COVID infection, but felt it should be reported.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was not seen at our facilities prior to or after COVID-19 vaccination. Patient received first dose on 1/23/2021 and as reported by the family member, patient expired on 2/5/21. Symptoms were reported to have stared on 2/1/2021, 9 days after receiving the first dose with a drop in oxygen levels and fever. He was reported to also have a history of chronic lung disease. Patient's family member to be contacted if necessary.		No prior vaccinations for this event.
	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient and her husband are elderly, but healthy and live independently. Patient took blood pressure medicine 'off and on' according to family. She was 5'2"", 120 pounds and slim and healthy and active, so was her husband, though he had pulmonary fibrosis so they had been staying home and not attending church etc, and masking when they did go out to protect against covid disease. They were both vaccinated with covid Pfizer vaccine (dose #1) on Thursday Feb 11. (02/11/2021) Thursday night as they went to bed they checked in with each other on how they each felt. Patient said she felt totally fine, and her husband said his arm was a bit sore. Patient woke before her husband on Friday Feb 12, went downstairs and, from what the family can tell, fixed herself a snack, then sat on the sofa. Patient's husband found her deceased on the sofa. He called 911 and they asked him to do CPR until the paramedics arrived. Because of proximity to covid vaccine, the ME wanted to examine the body in the home and also ordered an autopsy. Autopsy was completed on the same day as death, Feb 12, 2021"		No prior vaccinations for this event.

DEATH	**COVID19 (COVID19 (PFIZER-**

		BIONTECH)) (1200)
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."		No prior vaccinations for this event.

(1200)

"death was from natural causes; collapsed; This is a spontaneous report from a contactable consumer. A 73-year-old female patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 05Feb2021 at 73-years-old at a single dose for COVID-19 immunization. The patient's medical history included chronic obstructive pulmonary disease (COPD) from an unknown date and unknown if ongoing (on oxygen as needed, but not every day), oxygen therapy from an unknown date and unknown if ongoing. Concomitant medications were not reported. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (Gets flu shot every year around October). On 06Feb2021, the patient collapsed (medically significant) and experienced death was from natural causes (death, medically significant). The clinical course was reported as follows: The reporter stated that his grandmother received the first dose of the Pfizer COVID-19 vaccine on 05Feb2021 and passed away on the morning of 06Feb2021. The patient went to bed and woke up in the middle of the night around 03:00 to use the bathroom and collapsed and died within 10-15 minutes of collapsing. The patient was pronounced dead at the scene. The reporter asked: ""What do you know about the news in the media about reports of death in nursing home elderly patients?"" The reporter wanted to know the ingredients of the Pfizer COVID-19 vaccine. The reporter wanted to know about the use of the Pfizer COVID-19 vaccine in patients with underlying conditions. The patient had COPD and was on oxygen as needed, but not every day. The Medical examiner said the death was from natural causes and the family was not doing an autopsy. The patient had been tested for COVID and was negative. The patient underwent lab tests and procedures which COVID test: negative on an unspecified date. The clinical outcome of the event, death was from natural causes, was fatal. The clinical outcome of the event, collapsed, was unknown. The patient died on 06Feb2021 due to death was from natural causes. An autopsy was not performed. The batch/lot numbers for the vaccine, bnt162b2, were not provided and will be requested during follow up.; Reported Cause(s) of Death: death was from natural causes"

"Patient had swelling around her jaw after her second shot of the covid , Pfizer vaccine (.5 ml IM) on the Friday morning, January 29th, I took her to a follow up appointment with the cardiologist at 3:00 pm, as a follow up to a small heart attack event with hospitalization two weeks previously, at the cardiologist she was given the ok/all is well. That next morning early, she had a 911 event at her assisted living apartment and was sent back to the hospital, having had another heart attack. Patient died on the following Thursday, February 4, 2021. I do not know if the vaccination had any cause for my mothers death; but I feel it is necessary to report this series of heart attacks after she received the pfizer vaccine. Her Certificate of Death records the cause of death as ""Coronary Artery Disease""."

My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done to save his life. He subsequently passed away @ approximately 8:55 am CST on 2/11/21.		No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature

No prior vaccinations for this event.

again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as

treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.

chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history	No prior vaccinations for this event.	

included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and

voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

DEATH COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)	
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema	No prior vaccinations for this event.

and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

DEATH COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

92 year-old male with PMHx of vascular dementia, BPH, MDD, sleep disturbance , basal cell carcinoma of neck, osteoarthritis, BLE edema, Guillain-Barre syndrome 30 years prior, s/p COVID positive on 1/11/21 and received IV Bamlanivimab. Sent to hospital on 2/2/21 for altered mental status, generalized weakness with inability to lift bilateral UE and difficulty moving his BLE. He was treated for UTI with 7 days of Cefepime for Morganella Morganii. He was followed by neurology with MRI of the brain and CT of the spine without acute findings. Lumbar puncture unable to be obtained. He received 5 day course of IVIG for presumed Guillain-Barre . EMG showed generalized sensory motor polyneuropathy both axon loss and demyelinating type severe in degree. However, he did not recover from his GBS symptoms, was transferred back to the nursing home and died on 2/15/2021.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH))

		(1200)
died; This is a spontaneous report from a contactable consumer reporting for a patient. An 86-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), on 10Feb2021 at single dose for COVID-19 immunization. Concomitant medications were not reported. Relevant medical history included bacterial infection, the patient was being treated for bacterial infection and had spent 1 week in hospital within one month prior to being dosed with vaccine. On 17Feb2021 the patient died. The cause of death was unknown. It was unknown if an autopsy was performed. Information on the lot/batch number has been requested.; Reported Cause(s) of Death: death		No prior vaccinations for this event.
DEATH		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on 17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers		No prior vaccinations for this event.

turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of

No prior vaccinations for this event.

Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was

due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

Found dead at home slumped on the floor; Loss of appetite; Body aches; Feverish; A spontaneous report was received from a physician, concerning a 65-years-old male patient, who received Moderna's COVID-19 Vaccine and experienced feverish, body aches, loss of appetite, and death. The patient's medical history, as provided by the reporter, included diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia. Concomitant medications reported included metformin, glimepiride, lisinopril, atorvastatin, aspirin, methimazole, propranolol, and cilostazol. On 05 Jan 2021, prior to the onset of events, the patient received the first of two planned doses of mRNA-1273 (lot number 037k20a) for COVID-19 infection prophylaxis. On an unknown date in Jan 2021, some time after receiving the vaccine, the patient was feeling feverish with body aches and loss of appetite. On 09 Jan 2021 at approximately 21:30, the patient was found dead at home slumped on the floor. According to the paramedics, the patient was dead longer than when his wife found him, and no resuscitation was performed. Action taken with mRNA-1273 in response to the events was not applicable. The outcome of the events, feverish, body aches, loss of appetite, was considered resolved. The patient died on 09 Jan 2021. The cause of death was not reported. The reporter assessed the event, death, as not related to Moderna's COVID-	No prior vaccinations for this event.

19 Vaccine. The reporter did not provide assessment for the events, feverish and body aches, in relation to Moderna's COVID-19 Vaccine.; Reporter's Comments: This case concerns a 65 year old male patient with medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia, who experienced the serious unexpected event of death, non-serious unexpected event of loss of appetite, and non-serious expected events of fever and body pain. The event of death occurred 5 days after the first dose of mRNA-1273. The events of fever, body pain and loss of appetite occurred an unspecified period of time after the first dose of mRNA-1273. Very limited information regarding these events has been provided at this time. Based on temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Definitive causal association is confounded by age and medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia.

DECREASED APPETITE

COVID19 (COVID19 (MODERNA)) (1201)

Patient had the first Moderna Covid vaccine on Thursday 1/21/2021. She had a bit of sore arm on that day and the day after. On Saturday 1/23/2021, she had a fever of 100.5 F (11AM), nausea, light headache and chills. The temperature went down after she took ibuprofen. Patient's husband enrolled her to V-Safe to report all the adverse effects she experienced. On Sunday 1/24/2021, her temperature was 98.3F. She still had nausea and no appetite. She and her husband watched a football game in their bedroom upstairs. Husband noticed that his wife was pacing around the room many times. At 7Pm, Husband went downstairs for dinner but she refused to come down to eat. He went upstairs around 8pm, TV was still on. He turned off TV and went down stairs again thinking his wife felt as sleep while watching TV. He went back upstairs for bed around 10:30 PM. Husband said his wife had a deviated septum so she would snore very loudly when asleep. He didn?t hear her snoring so he went to check on her and found her not responsive. Husband called emergency services. Paramedic came at 10:45 and said patient was passed. Husband sent many texts to V-safe after that to report the incident. No response was received from V-safe. Patient?s doctor told her husband that she died due to cardiac arrest.

Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever,		No prior vaccinations for this event.

and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

DECREASED APPETITE

COVID19 (COVID19 (MODERNA)) (1201)

Mentation has declined since hospital discharger for fall on 2/6/20201. Patient has also had significant poor oral intake. Brought in due to apneic episodes. Abdominal pain - diffuse tenderness (right sided) Elevated liver enzymes - likely secondary to dehydration Increased serum creatine kinase - likely due to dehydration

DECREASED APPETITE

COVID19 (COVID19 (MODERNA)) (1201)

Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia	No prior vaccinations for this event.	
DECREASED APPETITE		**COVID19 (COVID19 (MODERNA)) (1201)**

Patient was transferred from hospital for further evaluation and care by pulmonologist. He started having symptoms a week before with fatigue, emesis, decreased p.o. intake, shortness of breath, vomiting and diarrhea. The two previous takes before death required increasing oxygen and family wanted everything done including intubation. He was transferred to ICU.	No prior vaccinations for this event.

Beginning in the evening 2/19/21, fever/chills/fatigue; worsening of symptoms 2/20/21 with lethargy/lack of appetite/weakness; unable to arouse on 2/21/21 then breathing stopped, patient's spouse called 911 performed CPR, EMS continued for 15 min then while in ambulance to hospital where he was pronounced dead. Official time of death 2:20pm	No prior vaccinations for this event.
DECREASED APPETITE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration,	No prior vaccinations for this event.

on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

(1200)

Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21

No prior vaccinations for this event.

DECREASED APPETITE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient developed fever to 102 within 24 hours with decreased mentation. Stopped eating/drinking despite aggressively treating fever. Was DNR B status. Family agreed to a trial of IV fluids on 1/21 but was not successfully started until 1/22 after several attempts. Family wanted only comfort measures with no transfer to hospital. Patient continued to have fevers to 102-103 range. Patient passed on 1/23 . Patient did test positive for COVID in early September without significant illness. She was in usual state of health prior to vaccination.

No prior vaccinations for this event.

DECREASED APPETITE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient stated he wasn't feeling well on January 25, 2021, wasn't eating and complained of abdominal pain. Patient noted to have indigestion and was constipated. Meds provided and labs ordered. On morning of January 26, 2021, patient became weak, lethargic and hypoxic and was sent to emergency department around 0700 hours on January 26, 2021. At approximately 1100 hours, emergency physician notified this writer that patient was not going to overcome his illness and would be placed on comfort care. At approximately 1130 hours, this writer was notified that patient had passed away from multi-organ failure.	No prior vaccinations for this event.

DEHYDRATION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was	No prior vaccinations for this event.

okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

COVID19 (COVID19 (MODERNA)) (1201)

on 1/13/2021 at 3:40am Cliff called for assistance. He lost his balance and had fallen. Cliff refused vitals, refused emergency department, denied hitting his head. As the day progressed patient developed a headache, diarrhea, and vomiting. He again declined the offer for the emergency room. At supper time wife and staff found Cliff unresponsive, 911 was called and he was taken to the emergency department. The ER did a CT scan and found an acute subdural hematoma. Patient was placed on comfort cares and expired at 3pm on 01/14/2021. Cliff did not have a history of falls.

Influenza vaccine 10/06/2020, age 88, fever, chills, vomiting, malaise

DIARRHOEA

COVID19 (COVID19 (MODERNA)) (1201)

On 2/1/2021, the patients daughter, who claims is a nurse, reported this incident to me. She stated that the evening after the patient received the vaccine, she felt some mild injection site pain. The morning after, the patient reported severe abdominal pain, diarrhea and vomiting. The patients daughter then called her physician to report these symptoms and attributed them as an adverse reaction to the vaccine at that time. These symptoms were intermittent for one week and no other adverse reactions were noted. In the early morning hours of 1/27/2021, the patient was toileting and had expired while doing so. An ambulance was called and cause of death was not found. An autopsy was not performed.	No prior vaccinations for this event.
DIARRHOEA	**COVID19 (COVID19 (MODERNA)) (1201)**
Toileting and had expired while doing so; Severe abdominal pain; Diarrhea; Vomiting; Mild injection site pain; A spontaneous report was received from a healthcare professional concerning an 88-year-old , female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events, toileting and had expired while doing so (death), mild injection site pain, severe abdominal pain, diarrhea, and vomiting. The patient's medical history was not provided. No relevant concomitant medications were reported. On 20 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 029L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 20 Jan 2021, the patient felt mild pain at the injection site after receiving the vaccine. On 21 Jan 2021, the patient reported severe abdominal pain, diarrhea and vomiting. These symptoms were intermittent for a week and no other adverse events were noted. On 27 Jan 2021, the patient passed away while toileting. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 27 Jan 2021. The cause of death was unknown. An autopsy was not performed.; Reporter's Comments: The gastrointestinal events were consistent with increased risk associate with elderly age of patient. The cause of death was unknown. Autopsy was not performed. Very limited information regarding the events is available at this time. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Reported Cause(s) of Death: unknown cause of death	No prior vaccinations for this event.

DIARRHOEA	COVID19 (COVID19 (MODERNA)) (1201)
Individual developed severe body aches, severe shoulder discomfort, high fevers (documented max temp. 103.7 F). Daughter reported that she became non-responsive with high fevers, and when the fevers decreased she was more lucid. Her condition rapidly progressed to nausea vomiting, diarrhea and patient died on 2/9/2021.	No prior vaccinations for this event.

DIARRHOEA	COVID19 (COVID19 (MODERNA)) (1201)
Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at	No prior vaccinations for this event.

the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia

DIARRHOEA	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient was transferred from hospital for further evaluation and care by pulmonologist. DIARRHOEA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Called PCP, from the note: I got my shot on Jan 19. But last Friday I have been down with a horrible flu. I'm wearing diapers because of uncontrollable diarrhea. I can't leave my sofa to walk over to my desk because I'll be so out of breath. I have a cough that produces a pink or gold Phelm I have dry mouth. I have no appetite I'm so weak and have lost 15 pounds. Don't know what to do. My next Covid is shot is feb 11 Called employer on 2/3/21 but hung up. Tried calling multiple times to follow up. In triage she stated she had a COVID test scheduled and had spoken with her PCP. COVID test through PCP: 2/4/21 She passed away the night of 2/4/21	No prior vaccinations for this event.	
DIARRHOEA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient began feeling nauseated on 1/18/21 around 6pm, and had uncontrolled diarrhea, reported that she did not feel right. Staff reported to this writer, that her skin tone was gray in tone and she just didn't look good. She was transferred to the HOSPITAL ER VIA AMBULANCE.	No prior vaccinations for this event.	
DIARRHOEA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Received Pfizer Covid Vaccine in the AM on 2/9/21. Arrived to emergency department later the same day complaining of nausea, weakness, fatigue, Vomiting, Diarrhea. Post operative diagnosis, Ischemic colon/toxic megacolon.	No prior vaccinations for this event.	
DIARRHOEA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
7 days after receiving the vaccine, patient suffered excessive diarrhea and slight coughing. 9 days after vaccine, patient was tested for Covid 19, and received positive results. Patient was transported to hospital via ambulance but hospital returned her to the nursing home since chest was clear, no respiratory issues, and no fever. 10 days after receiving the vaccine, patient was turned over to hospice care but still in the nursing home. Hospice was called in to provide better physician advice and access 24/7. 14 days after receiving vaccine, patient began experiencing excruciating body aches, coughing, low oxygen levels, and no appetite. 18 days after vaccine, patient died.	No prior vaccinations for this event.	
DIARRHOEA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative.	No prior vaccinations for this event.	

Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.

DIARRHOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Diarrhea , fatigue on 2/10 Fall 2/12 out to hospital Resident Expired 2/14 No prior vaccinations for this event.

DIARRHOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was	No prior vaccinations for this event.

diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her

husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

	DIARRHOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
patient was not vaccinated at hospital. Caregiver reports that patient was vaccinated with second dose on Monday 2/15/21. Tuesday patient experienced n/v/d. Went to an ED on Wednesday and was cleared and sent home. Thursday reported shortness of breath to her caregiver and then collapsed. Patient was brought to as PEA arrest and ultimately died.		No prior vaccinations for this event.

chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose		No prior vaccinations for this event.

of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol

sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they

No prior vaccinations for this event.

vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.

Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from nursing home staff report.	No prior vaccinations for this event.

DIFFERENTIAL WHITE BLOOD CELL COUNT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.	No prior vaccinations for this event.
DIFFERENTIAL WHITE BLOOD CELL COUNT	**COVID19 (COVID19 (PFIZER-BIONTECH))**

(1200)

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition:

No prior vaccinations for this event.

Deceased

DIFFERENTIAL WHITE BLOOD CELL COUNT ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the

No prior vaccinations for this event.

decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

DIFFERENTIAL WHITE BLOOD CELL COUNT ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.	No prior vaccinations for this event.
DIFFERENTIAL WHITE BLOOD CELL COUNT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated

No prior vaccinations for this event.

ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

DIZZINESS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Few minutes post vaccination, after moving to observation area via wheelchair, the patient complained of dizziness. She took glucose tabs she had brought with her. Staff wheeled her to Triage # 1. Her eyes rolled back in her head and she lost consciousness. Staff (paramedics on site) transferred her to gurney and started compressions. AED placed, V- Fib was rhythm, Shock # 1 given, CPR resumed. Shocked again. Fire truck and additional EMT arrived on site and took over care. Epinephrine was given 3 times via intra-osseous route, Amiodarone given intra-osseous route. Additional defibrillation with on site AED for a total of 6-7 times. Patient had good chest rise with ambu-bag, no airway obstruction or peri-oral edema noted. Code called at 12:40 PM.

DIZZINESS

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
Patient received the vaccine around 11 am. He hadn't been feeling well (headache, dizziness) per report and initially called in to work. He then decided to come to work and was found down in a patient bathroom during his shift on our Facility while taking care of a patient (he was a nurse aid). Patient was coded and the team and was transferred to our Facility ED. He expired 3/3 2112	No prior vaccinations for this event.
DIZZINESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
The same day that the person was vaccinated he started feeling dizzy and had difficulty breathing. He was hospitalized from February 5 to February 23. Patient died in the hospital on February 23, 2021	No prior vaccinations for this event.
DRUG INEFFECTIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
respiratory failure from COVID19; presented to the ER with COVID symptoms and was diagnosed/died on 09Feb2021 from respiratory failure from COVID19; presented to the ER with COVID symptoms and was diagnosed/died on 09Feb2021 from respiratory failure from COVID19; This is a spontaneous report from a contactable physician. An 89-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in 10Jan2021 at 12:00 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had no COVID prior to vaccination. The patient received one dose of Pfizer vaccine on 10Jan2021. The patient was presented to the ER with COVID symptoms and was diagnosed on 27Jan2021. Patient subsequently died on 09Feb2021 from respiratory failure from COVID19. It was unknown if autopsy was done. The patient was tested for COVID post vaccination via nasal swab: covid-19 virus test positive on 27Jan2021. The events resulted in emergency room/department or urgent care, hospitalization, and patient died. No follow-up attempts are possible, information about batch number	No prior vaccinations for this event.

cannot be obtained. No further information is expected.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported COVID post vaccination and respiratory failure with fatal outcome, and the administration of COVID 19 vaccine, BNT162B2, based on the reasonable temporal association. More information on the underlying medical condition in this 89-year-old male patient is required for the Company to make a more meaningful causality assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.; Reported Cause(s) of Death: presented to the ER with COVID symptoms and was diagnosed on 27Jan. Patient subsequently died on 09Feb from respiratory failure from COVID19; presented to the ER with COVID symptoms and was diagnosed on 27Jan. Patient subsequently died on 09Feb from

DRUG SCREEN NEGATIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency

No prior vaccinations for this event.

room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

Has underlying dementia and often with difficulty eating. 1 week after immunization she developed a stroke with left sided weakness and difficulty swallowing. Comfort measures instituted. Not sure if this is related to the vaccine, but thought I should report	No prior vaccinations for this event.
DYSPHAGIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An 85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19 immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything, nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not	No prior vaccinations for this event.

swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30 (on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and

will be requested during follow up.; Reported Cause(s) of Death: Heart stopped"

Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches;		No prior vaccinations

Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday for this event.

morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An

autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death		
	DYSPNOEA	**COVID19 (COVID19 (MODERNA)) (1201)**
12/30/2020 07:02 AM Resident noted to have some redness in face and respiration were fast. Resident vital signs were abnormal except blood pressure. Temp at the time was 102.0 F taken temporal. Resident respirations were 22 labored at times. Pulse is 105 and pulse ox 94% on room air. Resident is made comfortable in bed. Notified triage of change in condition also made triage aware of resident receiving Covid vaccination yesterday morning. Resident appetite and fluid consumption has been poor for few days. 12/30/2020 07:32 AM Received order from agency to administer Acetaminophen 650mg suppos rectally due to resident not wanting to swallow anything including fluids, medications and food. This writer administered medication as NP ordered. Will monitor for effectiveness and adverse effects if any. 12/30/2020 08:41 AM Received new orders to obtain Flu swab, obtain CBC and BMP, and Chest Xray all to be obtained today. Notified family of resident having temperature and vital signs excluding b/p that was abnormal. Family was thankful for call and inierated to nurse that family does not want resident sent to hospital. Did educate family on benefits of Hospice services, but family persistant on continued daily care provided by nursing staff. Requests visits if decline continues. Family assured if resident continues to decline, facility will accomandate resident family to be able to be at bedside when time comes to do so. NP ordered IVF and IV Levaquin on 12/31/20. Family chose at that time to sign for Hospice services and not have resident provided with IVF or IV Antibiotics		No prior vaccinations for this event.

COVID19 (COVID19

(MODERNA)) (1201)

Died; Increased respirations (22 and labored at times); Pulse 105; 94% O2 on RA; Labored breathing at times; leukocytosis; elevated BUN; left lower lung congestion; elevated creatinine; Temperature of 102.0F; Redness on face; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced redness on face, increased respirations, labored breathing at times, temperature of 102F, pulse of 105, 94 percent O2, leukocytosis, elevated BUN, left lower lung congestion, elevated creatinine, and death. The patient's medical history, as provided by the reporter, included dementia and reduced mobility. No relevant concomitant medications were reported. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient began to experience redness on her face, increased respirations (reported as 22 and labored at times), pulse of 105, and 94 percent oxygen saturation on room air. The patient had a fever of 102 degrees Fahrenheit. Laboratory tests revealed a negative influenza swab, elevated white blood cell count of 14.1, elevated BUN at 113, and creatinine 2.7. Chest x-ray showed mild, left lower lung infiltrate. On 31 Dec 2020, the patient went under hospice care per her family request.. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2021, the cause of death was unknown.; Reporter's Comments: This case concerns a 92-year-old, female subject with medical history of dementia and reduced mobility, who experienced the serious unexpected events of death, respiratory rate increased, heart rate increased, oxygen saturation decreased, elevated BUN, elevated creatinine, left lung congestion and dyspnoea and the non-serious events of erythema and pyrexia. The events of respiratory rate increased, heart rate increased, oxygen saturation decreased, dyspnoea, erythema and pyrexia occurred 2 days after the first dose of the study medication administration, and the event of death occurred 4 days after the first dose of the study medication administration. Very limited information regarding the events is available at this time and no definite diagnosis or autopsy report have been provided. Additional information has been requested.; Reported Cause(s) of Death: Died

had a near syncopal episode. She felt lightheaded and shortly after had episode of nonbloody vomiting. Hypotensive 81/69 and started on levophed. Alert and orientated. Lungs clear, abdomen benign on admission. Patient had no reaction when received first dose of the vaccine. Patient developed worsening shortness of breath, tachypnea, Afib with RVR, hypotension and required intubation and multiple pressors.	for this event.
DYSPNOEA	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.	No prior vaccinations for this event.

Approximately 2 weeks after the first COVID vaccine she developed shortness of breath that was much more significant than she had previously. This was the first time she had expressed this symptom to me as being something she was concerned about and difficult for her to manage (we have spoken almost daily for many years). Within 24 hours of the second dose of the mRNA vaccine, they called an ambulance to get her and she was taken to the hospital and diagnosed with bacterial pneumonia. The doctors said it was unrelated, but I found a study with a different vaccine (LAIV) that also seemed to increase the incidence of bacterial pneumonia. They hypothesized through diverting the immune system. So while I don't think the vaccine gave her the bacteria, I do think it may have caused her immune system to be temporarily compromised allowing the bacteria to grow out of control. I feel this is important to report to look for these types of patterns as perhaps it can help others avoid the death spiral that happened to my mother. There were also intervening events between her hospitalization and her death including two successful surgeries (one for a broken hip and another to put in stents in her leg). So to summarize, the first vaccine was within about 2 weeks of the onset of her breathing problems. Within 24 hours of the second vaccine she was hospitalized and diagnosed with bacterial pneumonia. As she was battling bacterial pneumonia in the hospital she broke her hip and was found to have reduced peripheral circulation and had 2 surgeries to correct those. They were successful according to the surgeons, however she died within a week or so of the surgeries. She had other comorbidities as well which I'm sure predisposed her such as diabetes, hypertension and cancer for many years.	Breathing issues ~2 weeks after first dose of mRNA vaccine in the series but were not nearly as acute or severe as they were fol

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from	No prior vaccinations for this event.

which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a		No prior vaccinations for

spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient this event. received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new		No prior vaccinations for this event.

periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on

admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Narrative: Patient with history advanced vascular dementia, hypertensive cerebrovascular disease and stroke, T2DM. Received her second dose of Pfizer COVID-19 vaccine at approximately 14:00 and was

No prior vaccinations for

reported to have expired at home at 20:55. Dr. (Medical Director) spoke with patient's son/caregiver 2/4/21. Son reports that patient was in her usual health yesterday morning, deemed well enough by son to travel for vaccination. He reports she had no bothersome symptoms after either first or second vaccinations. Specifically denied rash, wheeze, and difficulty breathing. Son was with patient throughout the day. In the evening, when preparing for bed, he noted she became suddenly unresponsive in a similar fashion as she has done several times in past years. While in all previous such episodes she recovered within minutes, last evening she did not regain consciousness, experiences a brief period of labored breathing, and died. Patient's son called 911 and the patient's body was brought to the medical examiners. The medical examiner declined to proceed with autopsy. Patient's son is not interested in autopsy. Patient's son reports confidence that his mother's underlying hypertensive/diabetic cardiovascular disease is the natural cause of her death. Other Relevant Hx: Symptoms: & Death Treatment:	this event.
DYSPNOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The	No prior vaccinations for this event.

following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

	DYSPNOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom only had site soreness after her covid vaccine on 1/21 which resolved within a couple days. However, she died in the early morning hours of 1/25, she was fine the day before, no sign of injury. We found her collapsed on the ground and although we tried cpr she was already dead. She had gone to the hospital on 12/28 for shortness of breath, angina and symptomatic anemia, her ekg was unchanged and blood work normal except for anemia. The cardiologist did not think a cardiac cath was needed. Her shortness of breath improved with a blood transfusion and a dose of lasix (no heart failure).		No prior vaccinations for this event.
	DYSPNOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Client was administered the vaccine while symptomatic (01/25/21) although client did not know he was symptomatic for COVID-19. He had been exposed to a family member who had tested positive and should have been in quarantine but wasn't either because it was not felt he was considered a close contact by his family opinion or his family member never notified public health of this close contact...?. Clinet had presented to the ED following day after vaccination for shortness of breath and fatigue and an antigen test		No prior vaccinations for this event.

showed he was positive for COVID-19. He was sent home that same day 01/26/21. He was back in ED on 01/28/21 for worsening symptoms and admitted to hospital and later placed on ventilator. He passed away on 02/09/2021 (date of death was per his wife).

	DYSPNOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is	No prior vaccinations for this event.

now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

	Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches,	No prior vaccinations for this event.

diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on

10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

2/7/21 Increased difficulty chewing, swallowing, evaluated by SLP and dietician. Diet texture down-graded x 2 with poor appetite and recent 6lb weight loss. 2/8/21-APRN updated regarding poor appetite and difficulty chewing as well as downgraded texture of diet. Also informed of increased s/s of discomfort and increased use of PRN Oxycodone for pain. 2/9/21- elevated temp 100.7. 2/9/21 Covid pcr test negative. 2/9/21- N.O.?s APRN BMP, Albumin and Pre-albumin Level in am. 2/11/21-elevated temp 100.4. Covid rapid test negative. 2/12/21- CBG recorded at 517 at 5:20 am. Resident also has an elevated temp of 100.9. Tylenol administered per order. Vital signs include resp 24, radial pulse 134, O2 sat 83%. Supplemental oxygen administered via nasal cannula. Head of bed elevated. DR. notified at time via telephone. Order given for sliding scale for CBG. Guardian updated regarding changes in residents condition, poor prognosis. Guardian requests Hospice eval and admit. Guardian requests comfort care no hospitalization, no IV's, no G-tubes, no labs etc, D/C of Palliative services. ARNP informed. 2/12/21 Acute Telehealth visit with APRN due to increased lethargy, elevated CBG?s despite poor appetite and insulin administration. Resident unresponsive to verbal and noxious stimuli at time of visit. N.O. Morphine sulfate 20mg/ml, give 2.5mg PO/SL Q4hr PRN pain/shortness of breath. 2/12/2021-Admitted to Hospice, Lethargic, diaphoretic, T 98.1 P 130's R 18 O2 high 80's to low 90's via O2 mask at 3L. 2/12/2021- Resident legs and arms noted to feel cool this afternoon, 02 sat was 97% with 02 on @ 3L with mask Noted resident with sob and increased pulse. Prn morphine 0.25ml sl. given with good effect. Resident was less restless and quiet in her bed. Checked on resident several times this shift for needs. Resident noted to not move in her bed @ 8:15pm	No prior vaccinations for this event.

and noted she was not breathing. Supervisor called and pronounced resident deceased.

DYSPNOEA	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.	No prior vaccinations for this event.

	DYSPNOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist		No prior vaccinations for this event.

and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of

breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197,		No prior vaccinations for this event.

creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

DEATH Narrative: Pt he reports he developed chills SOB body aches the same night as receiving the COVID vaccine on 1.26.2021-pt is currently reporting CheSt tightness and SOB Admitted to hosp: ICU with Bilateral Pulmonary Emboli, LLE DVT, NSTEMI, Arrhythmia.	No prior vaccinations for this event.

DYSPNOEA	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent	No prior vaccinations for this event.

plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and

No prior vaccinations for this event.

targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of

the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA- 1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death this event.

ELECTROCARDIOGRAM	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom only had site soreness after her covid vaccine on 1/21 which resolved within a couple days. However, she died in the early morning hours of 1/25, she was fine the day before, no sign of injury. We found her collapsed on the ground and although we tried cpr she was already dead. She had gone to the hospital on 12/28 for shortness of breath, angina and symptomatic anemia, her ekg was unchanged and blood work normal except for anemia. The cardiologist did not think a cardiac cath was needed. Her shortness of breath improved with a blood transfusion and a dose of lasix (no heart failure).	No prior vaccinations for this event.
ELECTROCARDIOGRAM	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from	No prior vaccinations for this event.

nursing home staff report.

	ELECTROCARDIOGRAM	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.		No prior vaccinations for this event.

ELECTROCARDIOGRAM ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Found dead at home slumped on the floor; Loss of appetite; Body aches; Feverish; A spontaneous report was received from a physician, concerning a 65-years-old male patient, who received Moderna's COVID-19 Vaccine and experienced feverish, body aches, loss of appetite, and death. The patient's medical history, as provided by the reporter, included diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia. Concomitant medications reported included metformin, glimepiride, lisinopril, atorvastatin, aspirin, methimazole, propranolol, and cilostazol. On 05 Jan 2021, prior to the onset of events, the patient received the first of two planned doses of mRNA-1273 (lot number 037k20a) for COVID-19 infection prophylaxis. On an unknown date in Jan 2021, some time after receiving the vaccine, the patient was feeling feverish with body aches and loss of appetite. On 09 Jan 2021 at approximately 21:30, the patient was found dead at home slumped on the floor. According to the paramedics, the patient was dead longer than when his wife found him, and no resuscitation was performed. Action taken with mRNA-1273 in response to the events was not applicable. The outcome of the events, feverish, body aches, loss of appetite, was considered resolved. The patient died on 09 Jan 2021. The cause of death was not reported. The reporter assessed the event, death, as not related to Moderna's COVID-19 Vaccine. The reporter did not provide assessment for the events, feverish and body aches, in relation to

No prior vaccinations for this event.

Moderna's COVID-19 Vaccine.; Reporter's Comments: This case concerns a 65 year old male patient with medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia, who experienced the serious unexpected event of death, non-serious unexpected event of loss of appetite, and non-serious expected events of fever and body pain. The event of death occurred 5 days after the first dose of mRNA-1273. The events of fever, body pain and loss of appetite occurred an unspecified period of time after the first dose of mRNA-1273. Very limited information regarding these events has been provided at this time. Based on temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Definitive causal association is confounded by age and medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia.

bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).

ELECTROCARDIOGRAM ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

COVID19 (COVID19

	(PFIZER-BIONTECH)) (1200)
Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.	No prior vaccinations for this event.

ELECTROCARDIOGRAM ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2

No prior vaccinations for this event.

remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

ELECTROCARDIOGRAM CHANGE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report." ELECTROMYOGRAM ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

92 year-old male with PMHx of vascular dementia, BPH, MDD, sleep disturbance , basal cell carcinoma of neck, osteoarthritis, BLE edema, Guillain-Barre syndrome 30 years prior, s/p COVID positive on 1/11/21 and received IV Bamlanivimab. Sent to hospital on 2/2/21 for altered mental status, generalized weakness with inability to lift bilateral UE and difficulty moving his BLE. He was treated for UTI with 7 days of Cefepime for Morganella Morganii. He was followed by neurology with MRI of the brain and CT of the spine without acute findings. Lumbar puncture unable to be obtained. He received 5 day course of IVIG for presumed Guillain-Barre . EMG showed generalized sensory motor polyneuropathy both axon loss and demyelinating type severe in degree. However, he did not recover from his GBS symptoms, was transferred back to the nursing home and died on 2/15/2021.

Influenza Vaccine

EMBOLIC CEREBELLAR INFARCTION

COVID19 (COVID19 (MODERNA)) (1201)

"This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with

No prior vaccinations for this event.

the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21."

was intubated. He developed pulmonary edema. Pt expired on 02-02-2021 at 10:13 PM.		this event.
	EMPHYSEMA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise.		No prior vaccinations for this event.

Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

ENCEPHALITIS	**COVID19 (COVID19 (MODERNA)) (1201)**
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021	No prior vaccinations for this event.
ENCEPHALOPATHY	**COVID19 (COVID19 (MODERNA)) (1201)**
Sudden death 2/7/21 @ 0309 Started acute encephalopathy & required intubation Soon after intubation went into cardiac arrest Likely severe acidosis.	No prior vaccinations for this event.
END STAGE RENAL DISEASE	**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccination at 14:20 2/26/21. Was observed until discharged at 15:15. Discharged per wheel chair to lobby in alert/stable condition, to wait on bus to take him home. At 18:00 his neighbor heard him fall, could not get patient to answer phone, found him unresponsive. Neighbor called 9-1-1, ambulance	No prior vaccinations for this event.

personnel could not revive patient. Coroner's office ruled his death as Natural Causes due to Hypertension, Cardiac disease, Diabetes, ESRD. There were no indication of anaphylactic reaction noted when I questioned the coroner's office. The Coroner's office/EMS were aware the patient had received the Moderna COVID 19 vaccination that day.		
	END STAGE RENAL DISEASE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident did not exhibit any side effects from the vaccine. Staff spoke with him in his room at approximately 7:20am and returned to his room just a few minutes later and he was unresponsive. When the RN got to the room he had CTB. Physician documented heart failure and end stage kidney disease on the death certificate.		No prior vaccinations for this event.
	ENDOSCOPY UPPER GASTROINTESTINAL TRACT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 71 yo male who passed away on 1/29/2021, medical cause of death ""cholangiocarcinoma, interval between onset and death 14 months. Since patient passed away within 42 days of the covid19 vaccine administration, we are required to complete a report to VAERS. Vaccine (Pfizer) was administered without complications. The patient denied any prior severe reaction to this vaccine or its components or a severe allergic reaction such as anaphylaxis to any vaccine or to any injectable therapy. Synopsis- 1/23 71 yo male presented to ED with upper GI bleed. PMH: DM, HTN, cholangiocarcinoma of biliary tract requiring recurrent paracentesis, COPD, perigastric and lower esophageal varices (not on beta blockers due to bradycardia). Pt has had 2 episodes of coffee ground emesis. Lactic 2.6, ammonia 52. Rec'd protonix, octreotide, and ceftriaxone in ED. Family has been previously encouraged to speak to palliative care but has never been willing to. GI consulted. 1/24 EGD completed. No signs of active bleed. MDs recommending		No prior vaccinations for this event.

hospice. CT + for small bowel ileus. 1/26 Requires placement of NG tube to suction. Palliative care consulted. 1/27 Paracentesis completed. 4100mls removed. 1/28 Pt changed to palliative status. 1/29 Pt passed away."

ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient vaccinated on 12/28. Approximately one day later, develops cough and on azithromycin x 1 week. On 1/3, patient develops left-sided weakness and aphasia. Taken to the hospital, tested COVID+, required intubation -- acute hypoxic respiratory failure secondary to COVID - on H&P. Patient died on 1/4/21 at 7:20am.	No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Fever Feeling tired short of breath all night and morning after the vaccine My grandma had to be intubated and then passed away to a heart distress we think it was the vaccine because she was fine even with dialysis. When she got the vaccine it took hours and her health conditions changed.	No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
1/24/21 0445- patient presents to the ED with complaints of neck pain, chest pain, and back pain for about a week. States also feels SOB, intermittent fever with temperature 100.3 on arrival. Patient was worked up for his cardiac type symptoms, found to have elevated WBC and CRP with no explanation. D-Dimer was elevated with CT showing no sign of PE. Patient was sent home from the ED with instructions to follow up with primary care and/or return if s/s worsen. 1/24/21 1705- patient is returned to the ED via ambulance after becoming unresponsive and some seizure like activity. Patient was intubated. Head CT showed large brain bleed that was irreparable and not compatible with life. Patient was also found with positive blood cultures x2 with gram	No prior vaccinations for this event.

positive cocci in clusters growing after 9 hours.

ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient presented to the Emergency Department complaining of chest pain, pale, cool diaphoretic, and hypotensive. The patient was discovered to have a large saddle pulmonary embolism, went into cardiac arrest and expired. Of note, the patient received her second Moderna COVID vaccine on 1/23, which would place her first one approximately 12/25 if she received them at the appropriate interval. This information is from the patient's daughter and the ED record, the information is not available in CAIR. Per the daughter, the patient started feeling ill on 1/21, improved on 1/25, and then acutely worsened on 1/27, resulting in the ED visit.	No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
36 hours after vaccination, the patient had increased respiratory distress. He was placed on high flow nasal cannula oxygen with mild improvement. He then continued to be hypotensive requiring IV fluids and subsequently IV vasopressors. Patient's BP was stabilized with vasopresor, however he continued to deteriorate clinically with altered mental status and lethargy, concerned for bowel peroration based on physical exam by MD. He was then emergency intubated and placed on mechanical ventilation. He was then transferred to acute care hospital near by.	No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt presented to ER via EMS at 1556 3 days after receiving vaccine. pt was breathing approximately 50 times a minutes and o2 sats in the 70's upon arrival. NP decided to intubate, Rocuronium and Versed given. Pt became bradycardic and 1 amp of Atropine was given without improvement. No pulse felt, CPR started per ACLS protocol. 7 Epi's given. Time of death- 1632. After TOD pt was swabbed for COVID-19 and the results	No prior vaccinations for this event.

were positive.

	ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.		No prior vaccinations for this event.
	ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident c/o nausea evening of 1/29 (nausea common for her post dialysis), had a large emesis at approx 2220, 0030 (unusual for resident to vomit)- received Zofran per order. Skin cool and damp, Blood sugar 147 (checked due to h/o diabetes and poor intake). At approx 230am Blood pressured checked and noted to be 52/29. Resident transferred to ER, intubated and transferred to higher level of care where she passed away on 1/30 at 736pm. Resident's medical notes indicated likely shock, cardiogenic in nature, sepsis (source unknown) along with a multitude of other co-morbidities that resident has.		No prior vaccinations for this event.
	ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident passed away unexpectedly on 01/19/21 after developing acute hypoxic respiratory failure on morning of 01/19/21. She was transferred to hospital via EMS where she was intubated, coded, and ultimately expired with uncertain underlying cause, potentially ACS.		No prior vaccinations for this event.

ENDOTRACHEAL INTUBATION		**COVID19 (COVID19 (MODERNA)) (1201)**
CARDIAC ARREST, DEATH Narrative: The patient presents to the emergency department in cardiopulmonary arrest. CPR was continued upon arrival. The Combi tube was removed and an endotracheal tube was placed without complications. ROSC was obtained multiple times but the patient continued to go into PEA. The patient was seen in the emergency department by both critical care and Cardiology. EKG shows ST elevations, but the patient was unstable to go to catheterization. The patient had 1 episode of asystole. Despite best efforts and multiple attempts we were unable to resuscitate the patient. Time of death 1253 on 1/24/21.		No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION		**COVID19 (COVID19 (MODERNA)) (1201)**
Moderna Vaccine Lot 029K20A Patient received second dose of vaccine on 2/2/21. Within 30 minutes patient had a near syncopal episode. She felt lightheaded and shortly after had episode of nonbloody vomiting. Hypotensive 81/69 and started on levophed. Alert and orientated. Lungs clear, abdomen benign on admission. Patient had no reaction when received first dose of the vaccine. Patient developed worsening shortness of breath, tachypnea, Afib with RVR, hypotension and required intubation and multiple pressors.		No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION		**COVID19 (COVID19 (MODERNA)) (1201)**
Sudden death 2/7/21 @ 0309 Started acute encephalopathy & required intubation Soon after intubation went into cardiac arrest Likely severe acidosis.		No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION		**COVID19 (COVID19 (MODERNA)) (1201)**

Patient was vaccinated on 1/14/2021. On 1/22/2021, patient tested positive for COVID-19 and admitted to the hospital for acute hypoxemic respiratory failure, COVID-19 pneumonia, and severe ARDS. Patient was intubated on 1/23/2021 and later died on 2/10/2021 after being extubated and placed on comfort measures.	No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine given in clinic per protocol - patient monitored for 15 minutes, no adverse reactions noted at the time. Patient stated he felt fine following 15 minute monitoring time. Patient left facility- it was later reported that pt had a fall at home. Upon review of pt's medical record - Pt's wife had to initiate CPR and call EMS for transportation and life saving measures enroute to the Emergency Room. Pt was intubated as pt was in asystole upon arrival to the ER, ACLS was continued, pt was noted to have a traumatic brain injury from his fall at home, and pt was pronounced dead at 1620.	No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient passed away on 2/2/21 after being admitted on 1/31/21 after receiving COVID19 Moderna Vaccine on 1/26/21. On initial report to the hospital patient reported having a cough for over 2 weeks (starting approx. 1/17/21). He had a postive COVID19 PCR on 1/31/21. Intubated on 1/31/21 and passed away on 2/2/21	No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Per EMS/Hospital report patient had difficulty breathing and cardiac arrest with prolonged CPR (greater than 45 mins in the ER) who was resuscitated. Family subsequently arrived including son and daughter and all family members were in the ER room are in agreement that patient would not want further aggressive cares given her extremely poor prognosis in light of chronic debilitation with numerous medical issues and now a very long period of CPR. Hospital Course After updating family they stated patient would not want further	No prior vaccinations for this event.

aggressive cares given her grim prognosis and chronic severe and debilitating medical issues. She continued to have myoclonic jerking. She was extubated to comfort cares in the ER and did not pass immediately therefore brought to a room. She received comfort cares and passed away at 0450 with family present.

	ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.		No prior vaccinations for this event.

	ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient experienced an episode of emesis and loss of consciousness several hours after vaccine on 2/16/21. He was taken by EMS to the hospital and was noted to be hypoxic and hypotensive. He was admitted to the hospital and subsequently intubated. He was also found to have a small bowel obstruction and a nasogastric tube was placed to decompress the bowel. He required pressor support as well. He expired on 2/17/21.		No prior vaccinations for this event.

	ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
"My grandpa had a stroke on the 15th of February. He claimed he had been feeling ""off"" for a few days, but didn't say anything. A blood clot had formed in his brain. He was doing better and about to go to rehab to		No prior vaccinations

strength his right side of his body. On the 22nd he took a turn for the worst. He was having trouble breathing and they sedated and partially paralyzed him to put a tube in his mouth. I believe another blood clot had formed and oxygen wasn't properly going through his body. They could not stabilize him, and he passed away the same day."	for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient was transferred from hospital for further evaluation and care by pulmonologist. He started having symptoms a week before with fatigue, emesis, decreased p.o. intake, shortness of breath, vomiting and diarrhea. The two previous takes before death required increasing oxygen and family wanted everything done including intubation. He was transferred to ICU.	No prior vaccinations for this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (MODERNA)) (1201)**
92 yo female who received her first dose of Moderna vaccine on 1/11/2021 with no known adverse effects. Admitted to the hospital on 1/17/21 with a spine compression fracture. Discharged and readmitted on 1/19 /21 with nausea and vomiting. Found to have new atrial flutter and elevated troponin attributed to NSTEMI. Discharge on Aspirin and Plavix. No cath. Second dose of Moderna vaccine 2/25/21. No immediate reaction. One hour later began to feel progressively weak. EMS called shortly after getting home. Intubated in the field. Died at 0658 on 2/26/21 s/p PEA arrest without ROSC.	No prior vaccinations for this event.

Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any	No prior vaccinations for this event.

symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.

ENDOTRACHEAL INTUBATION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA,

No prior vaccinations for this event.

shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and ACLS guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and ACLS guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.	No prior vaccinations for this event.

ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

For the two days prior to presentation the patient had been complaining of chest pain, his breathing seemed to be labored Monday. He and the family thought the pain was due to shingles as he carried this diagnosis from a month ago. Patient had also received the COVID vaccine 2 days prior to presentation and assumed he was feeling unwell due to the vaccine. Family wanted to take him to the hospital yesterday and earlier today but he refused. She left him in his home earlier this afternoon prior to presentation and returned to check on him finding him unresponsive and apneic at which time EMS was activated. #cardiac arrest -- suspect primary cardiac given collateral from family at home, consider hypoxemia which was corrected with advanced airway and 100% FiO2, patient clinically euvolemic and with soft brown stool in diaper not suggestive of GI hemorrhage, attempt to address acidosis with CPR and bicarbonate, not hypoglycemia, on bedside ultrasound FAST neg and no pericardial effusion suggestive of tamponade and +lung sliding bil not spontaneous pneumothorax Assessment/Diagnosis: -cardiac arrest, cause unspecified	No prior vaccinations for this event.

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.	No prior vaccinations for this event.

DEATH Narrative: Presented to ED via EMS c/o increasing shortness of breath, O2 sat mid to high 80s on 4L. When EMS arrived , pt was in distress, intubated by EMS and transported to ED. Pt had a PEA arrest	No prior vaccinations for

en route but resuscitated w/ return of spontaneous circulation after receiving a dose of epinephrine and chest compressions. Pt was hypotensive on arrival to ED. He was started on sepsis protocol , volume resuscitation and empiric antibiotics. Once stabilized, he was admitted to icu at hospital. Removed from respirator 2/22/21	this event.
ENDOTRACHEAL INTUBATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further	No prior vaccinations for this event.

improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was

pronounced at 2123 on 2/20/2021. Children were at bedside.

ENDOTRACHEAL INTUBATION	COVID19 (COVID19 (UNKNOWN)) (1202)
Patient was admitted to hospital from home in cardiac arrest. Hx of hypertension, hyperlipidemia, type 2 diabetes (not on insulin) and bilateral carotid artery stenosis. The patient was reportedly at his baseline health on 2/2/21. He received the 2nd dose of COVID vaccine around 1000AM on 2/2/21. Reportedly started running fever of 100.1 and chills the afternoon of 2/2/21. Around 7:00PM he started having dry cough and was complaining of breathing difficulties. He subsequently vomited multiple times (was eating pizza and aspirated) then lost consciousness. His wife called 911, did CPR and EMS reported he in PEA at scene and was intubated. Transported to hospital. SARS CoV-2 and influenza negative.	No prior vaccinations for this event.

ENTERITIS	COVID19 (COVID19 (MODERNA)) (1201)
Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.	No prior vaccinations for this event.

ENTEROVIRUS TEST NEGATIVE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
loss of consciousness Narrative: Patient received COVID-19 vaccine dose #1 on 1/6/21 w/o complications. Per 1/6/21- 1/9/21 nursing notes, patient did not experience any injection site reactions, denied pain or tenderness at injection site, no dizziness, no n/v, remained afebrile. Around 1/9/21 @1810, patient became acutely nonresponsive after being helped to the edge of bed. Per nurses, he was previously awake/alert, talking and asymptomatic. Patient is DNR/DNI but facility rapid response emergency team called d/t	No prior vaccinations for this event.

patient's sudden change of condition. Emergency team helped patient into lying position. Per 1/9/21 ICU emergency team note, patient appeared comfortable w/ no palpable radial pulse and had minimal shallow agonal breathing. Pulse ox 94%, HR in 60s per machine. BP unmeasurably low by BP cuffx3. Resident passed at 18:20 pm.

EOSINOPHIL COUNT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious,	No prior vaccinations for this event.

but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

EPIDERMAL NECROSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Presented from clinic with 3-4 days of extensive rash. There were multiple areas of skin sloughing on bilateral upper extremities and abdominal wall.	No prior vaccinations for this event.

EPISTAXIS

COVID19 (COVID19 (MODERNA)) (1201)

Resident became lethargic and reports of blood coming from resident's nose and mouth on the morning of 1/13/21. Resident went out to ER for eval, and came back to facility with dx of pneumonia and recommendations for resident to be placed on hospice. Resident deceased on 1/14/21. Unknown if vaccine related, but with timeline of events I was advised to report this per medical director of facility, as well as Pharmacy who administered the vaccine.

No prior vaccinations for this event.

EPISTAXIS

COVID19 (COVID19 (MODERNA)) (1201)

Patient received Moderna COVID vaccine on 12/30/2020 at a Pharmacy clinic where he was a resident. Nurses at the facility reported that he was responsive and showed no signs of any adverse effects until 1/2/2021 when he was observed slightly unresponsive and staring at the ceiling and trembling. He had a fever of 101F at this time. The facility ordered labs and a rapid COVID test (all of which came back normal) and

No prior vaccinations for this event.

started IV antibiotics. A few hours later, patient began bleeding from his eyes, nose, and mouth and was sent to the local ER. The patient refused being admitted to the ICU for possible sepsis/hemorrhage and died the following day on 1/3/2021. All healthcare professionals involved agreed that this was not likely due to the vaccine, but needed to be reported nonetheless.

EPISTAXIS **COVID19 (COVID19 (MODERNA)) (1201)**

epistaxis. No prior vaccinations for this event.

ERUCTATION COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

On 2/4/21, at around 3:00pm he began feeling very tired and he began burping in the evening. The following morning, he woke up early and was still burping and not feeling well. At around 5:00am, he collapsed. My mother called 9-1-1 and began giving CPR. The parademics arrived and tried to revive him, and transported him to the hospital but at 6:11am, he was pronounced dead of a heart attack. He was healthy. No prior vaccinations for this event.

ERYTHEMA **COVID19 (COVID19 (MODERNA)) (1201)**

Redness and warmth with edema to right side of neck and under chin. Resident was on Hospice services and expired on 1.1.21 No prior vaccinations for this event.

ERYTHEMA **COVID19 (COVID19 (MODERNA)) (1201)**

12/30/2020 07:02 AM Resident noted to have some redness in face and respiration were fast. Resident vital signs were abnormal except blood pressure. Temp at the time was 102.0 F taken temporal. Resident respirations were 22 labored at times. Pulse is 105 and pulse ox 94% on room air. Resident is made No prior vaccinations for this event.

comfortable in bed. Notified triage of change in condition also made triage aware of resident receiving Covid vaccination yesterday morning. Resident appetite and fluid consumption has been poor for few days. 12/30/2020 07:32 AM Received order from agency to administer Acetaminophen 650mg suppos rectally due to resident not wanting to swallow anything including fluids, medications and food. This writer administered medication as NP ordered. Will monitor for effectiveness and adverse effects if any. 12/30/2020 08:41 AM Received new orders to obtain Flu swab, obtain CBC and BMP, and Chest Xray all to be obtained today. Notified family of resident having temperature and vital signs excluding b/p that was abnormal. Family was thankful for call and inierated to nurse that family does not want resident sent to hospital. Did educate family on benefits of Hospice services, but family persistant on continued daily care provided by nursing staff. Requests visits if decline continues. Family assured if resident continues to decline, facility will accomandate resident family to be able to be at bedside when time comes to do so. NP ordered IVF and IV Levaquin on 12/31/20. Family chose at that time to sign for Hospice services and not have resident provided with IVF or IV Antibiotics

death of unknown cause; Swelling on Right side of the neck and under chin; Warmth on right side of neck and under chin; Redness on right side of neck and under chin; A spontaneous report was received from a healthcare professional concerning an 89-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced events of redness, warmth and swelling on right side of neck and under chin, and death of unknown cause. The patient's medical history included Alzheimer's and chronic obstructive pulmonary disease (COPD). No concomitant medications were reported. On 29 Dec 2020, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: Unknown) intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient experienced the events of redness, warmth and swelling on right side of neck and under chin. There was no indication that the patient was transferred out to hospital, which was unlikely because she was under hospice care. On 01 Jan 2021, the patient died due to an unknown cause of death. Action taken with mRNA-1273 in response to

No prior vaccinations for this event.

the events was not applicable. The patient died on 01 Jan 2020. The cause of death was not provided. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns a 89-year-old, female subject with a medical history of Alzheimer's and chronic obstructive pulmonary disease (COPD) who experienced redness, warmth and swelling on R side of neck and under chin and expired from an unknown cause. The events of redness, warmth and swelling on R side of neck and under chin occurred 2 days after administration of the first and only dose of the mRNA-1273 vaccine and patient expired 4 days after mRNA-1273 vaccine administration. Lot # of the vaccine was not provided. De-challenge and re-challenge are not applicable. The events of redness, warmth and swelling on R side of neck and under chin are temporarily associated with the administration of the mRNA-1273 and thus, a causal relationship cannot be excluded. Due to limited information, the fatal outcome was considered unrelated to mRNA-1273 administration pending additional information. Fatal outcome is confounded by the patient's underlying condition and advanced age.; Reported Cause(s) of Death: Unknown cause of death

	(1200)
Approximately 2 weeks post vaccination developed rapid AF, CHF. Admitted to Medical Center. Discharged home on hospice. Patient died at home on 2/13/2021. Reported to this reporter at second dose clinic on 2/16/21. Other details not known. Unknown if related to vaccine.	No prior vaccinations for this event.
EXPOSURE TO SARS-COV-2	**COVID19 (COVID19 (MODERNA)) (1201)**
At the time of vaccination, there was an outbreak of residents who had already tested positive for COVID 19 at the nursing home where patient was a resident. About a week later, patient tested positive for COVID 19. She had a number of chronic, underlying health conditions. The vaccine did not have enough time to prevent COVID 19. There is no evidence that the vaccination caused patient's death. It simply didn't have time to save her life.	No prior vaccinations for this event.
EXPOSURE TO SARS-COV-2	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient diagnosed with COVID on January 9, 2021 after being exposed to family member that was under quarantine in the same household. Admitted to the hospital and was discharged on January 14, 2021 with home hospice. Patient passed away on January 18, 2021	No prior vaccinations for this event.
EXPOSURE TO SARS-COV-2	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient rcvd 1st covid 19 vaccine on 1/26/2021. Patient had house guests on 1/30/21. Those house guests tested positive for covid on 2/1/2021. Patient started getting symptoms on 02/2/2021. Patient tested postivie on 2/4/2021. Patient was hospitalized 2/7/2021. Patient passed away on 2/21/21.	No prior vaccinations for this event.

EXPOSURE TO SARS-COV-2		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
71yo female resident who died after receiving Pfizer BioNTech vaccine. On 1/14/2021, VS taken at 10am, B/P 99/60, O2 sats, 95% (trach w/O2). At 11:30am, Patient showed no s/sx of distress, A&Ox3. At 11:50am, a nurse went to perform a COVID test and assessment (the facility is experiencing an outbreak), and found the patient unresponsive on the bathroom floor. CPR was immediately started; no shock advised per AED; 12:15pm EMS arrived and took over. At 12:38pm, EMT called time of death.		No prior vaccinations for this event.
EXPOSURE TO SARS-COV-2		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
All residents had been in isolation due to multiple cases of COVID in the facility. Resident voiced no health related complaints. He continued to visit with staff and required moderate assist with toileting. Resident had fall 0130 on 1-15-2021, which resulted in laceration with surgical repair. Resident was noted to change in mental status and respirations on morning of 1-16-2021 during morning blood sugar check. Resident had O2 @1.5l/m via n/c and respirations of 10 with periods of apnea and unresponsive to verbal stimuli. Blood sugar was 583. Resident deceased upon re-check after calling PCP to report status change.		No prior vaccinations for this event.
EXPOSURE TO SARS-COV-2		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident was vaccinated on 12/31/20. Then on 1/14/21 he tested positive for SARS-CoV-2 on routine surveillance PCR testing. Another resident on the same hall was COVID positive on 1/11/21. Results of the PCR test were obtained on 1/16/21. He appeared asymptomatic at that time. Given his COVID positive status, all aerosol generating procedures had to be stopped. Overnight on 1/16/21 into 1/17/21, he had the		No prior vaccinations for this event.

onset of acute respiratory failure and was transported to the hospital. Per notes, he was put on BiPAP for several hours, but his CO2 level did not improve. Per prior advance directives completed with the resident and his two brothers, he had DNR/DNI orders. The hospital physician spoke with his brother and the decision was made to move to comfort care. He was discharged to inpatient hospice and died around 4pm on 1/18/21. This outcome does not appear to be vaccine-related, but death from COVID-19 infection is listed as a reportable event following COVID-19 vaccination.

EXPOSURE TO SARS-COV-2

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Client was administered the vaccine while symptomatic (01/25/21) although client did not know he was symptomatic for COVID-19. He had been exposed to a family member who had tested positive and should have been in quarantine but wasn't either because it was not felt he was considered a close contact by his family opinion or his family member never notified public health of this close contact...?. Clinet had presented to the ED following day after vaccination for shortness of breath and fatigue and an antigen test showed he was positive for COVID-19. He was sent home that same day 01/26/21. He was back in ED on 01/28/21 for worsening symptoms and admitted to hospital and later placed on ventilator. He passed away on 02/09/2021 (date of death was per his wife).

No prior vaccinations for this event.

EYE HAEMORRHAGE

COVID19 (COVID19 (MODERNA)) (1201)

Patient received Moderna COVID vaccine on 12/30/2020 at a Pharmacy clinic where he was a resident. Nurses at the facility reported that he was responsive and showed no signs of any adverse effects until 1/2/2021 when he was observed slightly unresponsive and staring at the ceiling and trembling. He had a fever of 101F at this time. The facility ordered labs and a rapid COVID test (all of which came back normal) and started IV antibiotics. A few hours later, patient began bleeding from his eyes, nose, and mouth and

No prior vaccinations for this event.

was sent to the local ER. The patient refused being admitted to the ICU for possible sepsis/hemorrhage and died the following day on 1/3/2021. All healthcare professionals involved agreed that this was not likely due to the vaccine, but needed to be reported nonetheless.		
	EYE MOVEMENT DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Placed resident back in bed found 82% o2 sats B/P 110/106 pulse 110 resp below 16 placed o2 via non rebreather with 20 l/min 02 up to 90% then stabilized at 89% Resident following all commands encouraged to take do breathing exercises, with some compliance, continues ABT/pneumonia , no s/s adverse 1/23/2021 16:48 Discharge Summary Note Text: Resident found unresponsive with no pulse or respirations in bed with emesis on gown. Time of death verified at 1645 with LPN. Funeral Home called at 1900 and body released at 2000.		No prior vaccinations for this event.
	EYE MOVEMENT DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Few minutes post vaccination, after moving to observation area via wheelchair, the patient complained of dizziness. She took glucose tabs she had brought with her. Staff wheeled her to Triage # 1. Her eyes rolled back in her head and she lost consciousness. Staff (paramedics on site) transferred her to gurney and started compressions. AED placed, V- Fib was rhythm, Shock # 1 given, CPR resumed. Shocked again. Fire truck and additional EMT arrived on site and took over care. Epinephrine was given 3 times via intra-osseous route, Amiodarone given intra-osseous route. Additional defibrillation with on site AED for a total of 6-7 times. Patient had good chest rise with ambu-bag, no airway obstruction or peri-oral edema noted. Code called at 12:40 PM.		No prior vaccinations for this event.

EYE MOVEMENT DISORDER	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done to save his life. He subsequently passed away @ approximately 8:55 am CST on 2/11/21.	No prior vaccinations for this event.

EYE SWELLING	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
On December 17, 2020, my husband, received his first BioNTech BNT162b2 COVID-19 vaccination. On Thursday January 7, 2021, he received this second COVID-19 vaccination. The following three days after his second vaccination, he felt fine. The fourth day, on Sunday January 10, my husband felt extremely fatigued. On Monday the 11th and Tuesday the 12th, he worked a full shift but complained of extreme fatigue and extreme chills to the point that his teeth were chattering while on the phone with me. He decided to work through it. When he got home on Monday night, he started vomiting. On Wednesday January 13, he woke up and had swollen eyes. Once again, he felt extremely fatigued, even after a full	No prior vaccinations for this event.

nights rest. He had the day off but had an early meeting. After his meeting, he was still tired so he went back to sleep. I left to get lunch, and drop off our kids, and upon my return, I found him on the walk in closet floor, face up, having passed away. He felt as cold as ice. The rapid test done after they called the paramedics resulted in a negative COVID-19 test for him.

FACIAL PARALYSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Developed acute facial droop and slurred speech 2h after 1st dose of the vaccine on 2/17, found with R MCA stroke. Then became unresponsive on 2/27 and was found with an acute L MCA stroke. Was transferred from another hospital, was not a candidate for intervention, and was made comfort and died on 2/28	No prior vaccinations for this event.
FAECES DISCOLOURED	**COVID19 (COVID19 (MODERNA)) (1201)**
Hypoxia, Decreased responsiveness, Narrative: 86yo male with PMHx HTN, Afib not on AC after head trauma, CVA, and colon cancer who was brought to the ED by his family on 2/17. Per documentation the pt was in his usual state of health until 2/16. Received Moderna covid vaccine #2 on 2/16/21 at 0900, and was monitored for 15 minutes following immunization no noted issues. Later that night, had myalgias and took Tylenol. Per the family he slipped on the ice and fell on his butt. Overnight, had several dark stools and vomitus. was brought to the ED by his family because he was being less responsive. Pt arrived to the emergency department in extremis. No pulse identified. CPR immediately initiated for several rounds lasting about 25-30 minutes. ROSC unable to be achieved. Patient expired on 2/17 at 1941. Of note, per previous documentation had waxing and waning mental status at baseline. No symptoms noted with 1st dose of Moderna vaccine, which was administered on 1/16/21.	No prior vaccinations for this event.

23 hours before being transported to the hospital. That was Thursday afternoon. He was diagnosed with COVID-19 on Saturday night and died the following Friday morning.	for this event.
FALL	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt was hospitalized Jan 18, 2021 after he had fallen outside overnight and lay there approximately 12 hours until he was found. Hypothermic & rhabdomyolis diagnosis. Gradually improved w/ strength & mental status - was in swing bed @ hospital. He got his first Covid 19 shot on 2-8-21. Was fine @ 0300 on 2-9-21 and @ 0430 he was found unresponsive. Dx: probable arrythmia & pronounced dead @ 0454. Noted on pain scale @ 2/8/21 @ 21:11, clients pain was a 7/10 They offered pain med & he refused They repositioned & distracted him @ 2047 on 2/8/21 Pain had decreased to 3/10 and nothing given. Then @ 0300 check he was sleeping and @ 0430 unresponsive.	No prior vaccinations for this event.
FALL	**COVID19 (COVID19 (MODERNA)) (1201)**
"Was given vaccine around 1:30Pm on 2-11-2021. He and his wife waited in the building for 15 minutes and then left. he denied complaint. (He was waiting to have both Covid shots before he went to cardiologist Re: CAD.) He had an alarm going off in his house, was going to basement to check it out. Police officer heard alarm, came into house, & heard a thud when Doc fell. He was in PEA (Pulseless Electrical Activity) when brought into ER. Given 5 ""rounds of Epinephrine with no response."	No prior vaccinations for this event.
FALL	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident yelling for assistance in apartment. Nursing personnel found resident on floor at 6:10 AM on 2/18/2021. Resident was transported to Hospital on 2/18/2021. Status update on 2/18/2021 from son, resident CT & X-rays were done all normal. Labs done and WBC count was elevated and awaiting results.	No prior vaccinations for this event.

Resident stable and admitted to hospital for observation. Resident passed away on 2.21.2021.

FALL		**COVID19 (COVID19 (MODERNA)) (1201)**
Since I was not with my husband I can only tell you what was told to me. He walked out of the store toward our car. Someone watched him, concerned, because he was walking very slowly (normally has a slow gait because of leg braces and toe amputations so I don't know if it was unusually slow). The woman saw him fall and she ran to help-administered CPR immediately-and told me he died instantly. Medics tried to resuscitate and failed to bring a pulse. (My husband left our home around 11:15 to drop a package off at store. The store is one mile from our home. At around 12:30 a deputy came to my door and when I saw him my knees buckled. I knew something horrible happened.		No prior vaccinations for this event.
FALL		**COVID19 (COVID19 (MODERNA)) (1201)**
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and		No prior vaccinations for this event.

vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

FALL

COVID19 (COVID19 (MODERNA)) (1201)

Hypoxia, Decreased responsiveness, Narrative: 86yo male with PMHx HTN, Afib not on AC after head trauma, CVA, and colon cancer who was brought to the ED by his family on 2/17. Per documentation the pt was in his usual state of health until 2/16. Received Moderna covid vaccine #2 on 2/16/21 at 0900, and was monitored for 15 minutes following immunization no noted issues. Later that night, had myalgias and took Tylenol. Per the family he slipped on the ice and fell on his butt. Overnight, had several dark stools and vomitus. was brought to the ED by his family because he was being less responsive. Pt arrived to the emergency department in extremis. No pulse identified. CPR immediately initiated for several rounds lasting about 25-30 minutes. ROSC unable to be achieved. Patient expired on 2/17 at 1941. Of note, per previous documentation had waxing and waning mental status at baseline. No symptoms noted with 1st dose of

No prior vaccinations for this event.

Moderna vaccine, which was administered on 1/16/21.

He continued to visit with staff and required moderate assist with toileting. Resident had fall 0130 on 1-15-2021, which resulted in laceration with surgical repair. Resident was noted to change in mental status and respirations on morning of 1-16-2021 during morning blood sugar check. Resident had O2 @1.5l/m via n/c and respirations of 10 with periods of apnea and unresponsive to verbal stimuli. Blood sugar was 583. Resident deceased upon re-check after calling PCP to report status change.		No prior vaccinations for this event.
	FALL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An 85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19 immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything, nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the		No prior vaccinations for this event.

patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30 (on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart stopped"

	FALL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Myocardial infarction Narrative: PMH significant for aortic valve stenosis, mitral valve stenosis, CKD, CHF, DM, HTN, obesity, hypothyroidism and dyslipidemia. Per report from primary care - the patients wife reports that the patient went on Saturday (1/30/21 - about 1050) morning to receive his COVID vaccine. He returned home and told her about the experience and denied any side effects. He then proceeded to sit in his easy chair for a while and around 1:30, she asked him if he wanted any lunch. The patient's wife reports he ""grumbled"" at her, and then got up to go to the bathroom. She then heard a loud crash and found him lying on the floor of the bathroom, with his head knocking hole in the wall as he fell. She could not detect a pulse. She called 911 and began compressions. First responders to the scene likewise tried to revive him but were not successful in her efforts. Per primary care documentation - Uncertain if related to Pfizer vaccine; vaccine administered on 1/30/21 and approximately 3 hours later suffered fatal MI at home." 	FALL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient expired. Per Emergency MD note: ""This is a 72-year-old male with what sounds like diabetes, atrial fibrillation, and hypertension who presents via EMS in cardiac arrest. It sounds like he received his Covid vaccine last week. Initially he had some mild effects from it. However over the last day or so he has felt very unwell. He apparently called his wife today and told her that he was not feeling well and so she returned home. Shortly thereafter he attempted to get up from his chair. He then collapsed and fell forward onto his face. Sounds like his wife had some difficulty rolling him over to perform CPR. When EMS arrived they found him in PEA. He received a total of 5 rounds of epinephrine. At some point they did have return of spontaneous circulation. However just prior to arriving in the emergency department they lost pulses again. The patient was intubated with an 8 oh endotracheal tube prior to arrival.""""		No prior vaccinations for this event.

FALL	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information	No prior vaccinations for this event.

and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

FALL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note).	No prior vaccinations for this event.

Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."

	FALL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received the vaccine at an outside healthcare facility on 2/11/21. At approximately 1 pm she screamed out and fell out of her chair. EMS was called and patient was found to be in Vfib. ACLS was performed for approximately 42 minutes prior to arrival at ED. At that time the patient had been pulseless for 25 minutes. Patient received 450 mg of amiodarone, epinephrine x7, sodium bicarbonate x2, and 7 AED shocks. In the ED 3 more doses of epinephrine were given, one more dose of sodium bicarbonate, and 5 additional shocks. ROSC was not achieved and time of death was called at 1416. 1/13/21 pt came into clinic for vaccine. Had difficulty remembering age. Called me Mon. 1/18/21 stating she was sick. When asked what her sx were, she stated fatigue. She was well the night of the shot, Thur. and Fri. but became tired on Sat. and Sun. I went through other sx with her such as h/a, fever, n/v, muscle aches, weakness and she said she experienced none of those. I questioned her about eating and drinking and she said she ate and drank water. She seemed fine so I told her to call her doctor if she was worse or the fatigue persisted or call 911. She agreed. Two staff from clinic called her Mon. and Tues, (1/18 and 1/19). On Tues. she may have had sl slurred speech. She was found deceased on	No prior vaccinations for this event.
FATIGUE	**COVID19 (COVID19 (MODERNA)) (1201)**
My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he	No prior vaccinations for this event.

collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.

Narrative: Patient experienced cardiac arrest with PEA and a witnessed collapse upon arrival to the emergency department on 1/24/21. Patient received his first dose of the COVID vaccine on 01/15/2021and felt poorly thereafter. He was describing shortness of breath to his wife and requiring 5L of O2 at home to maintain saturations in 80s, while he usually was on 3L to maintain saturations in the mid 90s. He had been oriented but more fatigued than normal and described bilateral shoulder pain (which was not new for him) as well as	No prior vaccinations for this event.

indigestion. Took Tylenol with some relief. He had decreased PO intake and less appetite. The patient's wife encouraged him to come to the hospital daily for a week prior to admission, but the patient did not want to because he felt his side effects were secondary to the vaccine. Symptoms:RespDepression, Palpitations, Syncope & cardiac arrest Treatment: EPINEPHRINE 1 MG ONCE 3 rounds given ,CALCIUM CHLORIDE 1000 MG ONCE

FATIGUE		**COVID19 (COVID19 (MODERNA)) (1201)**
Death Narrative: Patient received the first COVID-19 dose on 12/23. Afterwards, patient complained of localized pain on L deltoid area where the vaccine was administered; his temperature was 98.1 F. On 12/26-27, staff reported that patient appeared more fatigued than usual and was shivering on 12/27, which seized after blanket was given. On 12/28, patient presented with fever (Tmax 100.2 F) and acetaminophen was administered for alleviation of fever. ADR was reported for the fever on 12/29. Patient continued to decline and was placed back on hospice care on 12/29; on 12/30. the symptoms reported on nursing note include erythema and pain on whole L arm. Lidocaine was applied. Patient's family and provider mutually agreed not to administer the second dose of vaccine. He continued to decline and was started on end-of-life care around 1/4 and passed on 1/20 1417.		No prior vaccinations for this event.

FATIGUE		**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and		No prior vaccinations for this event.

Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.

FATIGUE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient presented to emergency room on 2/1/2021 with a chief complaint of having a chronic headache and fatigue following receipt of the Moderna vaccine 10 days prior. Following examination by the physician, the patient was diagnosed with an acute subdural hematoma. The patient subsequently underwent decompressive surgery, however demonstrated worsening neurologic status over the next several days and ultimately expired on 2/4/2021. Passed away; tired; nonresponsive; cold; difficulty breathing; swelling; sore arm; feeling weird and funny; A spontaneous report (United States) was received from a consumer concerning a 63 year old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and the patient experienced limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal and the patient passed away . Medical history included treatment for tuberculosis and dialysis. Concomitant medication included calcium acetate, Renvela, glipizide, omeprazole, aspirin, vitamin D, losartan, furosemide, rifampin, and Sensipar. On 14 Jan 2021, the patient received the first of their first planned doses of mRNA-1273 (lot number 030L20A) for prophylaxis of COVID-19 infection. On 13 Jan2021, the patient tested negative for COVID-19). On 16 Jan 2021, the patient experienced a sore arm, and feeling weird/funny. On 17Jan2021, the patient experienced difficulty breathing and swelling. On 18 Jan 2021, the patient declined dialysis, was tired and wanted to lay down. At 8 am, the patient was found nonresponsive and cold and is believed to have passed away around 4 am. The coroner tested the deceased for COVID-19 and the test was positive. No	No prior vaccinations for this event.	

autopsy was reported. No death certificate was issued at the time of the report but the reporter believes it will list cause of death as COVID complications. Action taken with the mRNA-1273 was not applicable. The outcome of the events of limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal, was fatal. On 18 Jan 2021, the patient was died. Cause of death was COVID-19. Autopsy details were not provided.; Reporter's Comments: The events developed on four days after first dose of mRNA-1372. Dyspnea, unresponsive to stimuli, and death were consistent with infection in pandemic set up confounded by age of patient and refusal of dialysis Cause of death was reported as COVID-19. Autopsy details were not provided. Based on reporter's causality the events are assessed as unlikely related to mRNA-1273.; Reported Cause(s) of Death: COVID-19

FATIGUE

COVID19 (COVID19 (MODERNA)) (1201)

Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am

No prior vaccinations for this event.

unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

(1200)

loss of consciousness; respiratory distress Narrative: Patient tolerated his 1st dose of the COVID-19 vaccine well, on 12/16/2020, and received his 2nd dose on 1/6/2021. Patient had some mild clinical decline the past few days prior to 2nd vaccination, with a decreased appetite and some increased fatigue per nursing report, but no significant changes. He experienced nausea on the evening of 1/6/21, which was effectively managed, but by early morning he spiked a fever of 102.9 with a sat of 86.1%. He continued to deteriorate from that point on and died 1/7/21 @13:20. Clinically, the presentation was most consistent with an aspiration pneumonia.

FATIGUE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My father was in weak condition to begin with. He didn't get out of bed for the next few days after receiving the vaccine. The little amount that he ate was consumed in bed. He began aspirating his food which lead to pneumonia. He wasn't strong enough to fight off the pneumonia even with antibiotics. He died on 1/23/21. While he might have passed soon in any case, I believe that the vaccine may possibly have increased his weakness/exhaustion thereby hastening his demise.		No prior vaccinations for this event.
FATIGUE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not		No prior vaccinations for this event.

given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.

	On December 17, 2020, my husband, received his first BioNTech BNT162b2 COVID-19 vaccination. On Thursday January 7, 2021, he received this second COVID-19 vaccination. The following three days after his second vaccination, he felt fine. The fourth day, on Sunday January 10, my husband felt extremely fatigued. On Monday the 11th and Tuesday the 12th, he worked a full shift but complained of extreme fatigue and extreme chills to the point that his teeth were chattering while on the phone with me. He decided to work through it. When he got home on Monday night, he started vomiting. On Wednesday January 13, he woke up and had swollen eyes. Once again, he felt extremely fatigued, even after a full nights rest. He had the day off but had an early meeting. After his meeting, he was still tired so he went back to sleep. I left to get lunch, and drop off our kids, and upon my return, I found him on the walk in closet floor, face up, having passed away. He felt as cold as ice. The rapid test done after they called the paramedics resulted in a negative COVID-19 test for him.	No prior vaccinations for this event.

	FATIGUE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
	Patient (now deceased) received 1st dose of Pfizer-BioNTech vaccine around December 21, 2020 and was noticed to be scratching, fatigued, and unresponsive by a family member on December 24, 2020. He received the second dose of the same vaccine around January 22, 2021. Pockmarks and bleeding scratch marks were noted by a family member on the patient's face prior to this second dose. On January 28, 2021 a family member was alerted that the patient was suffering from severe bullous pemphigoid- a skin	No prior vaccinations for this event.

condition that has never been experienced by the patient, has been reported to be related to COVID-19 viral infection, and to T-cell responses promoted by vaccines. A corticosteroid was given, but did not work. Blisters developed to the point hands had to be dressed.

	FATIGUE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On 2/4/21, at around 3:00pm he began feeling very tired and he began burping in the evening. The following morning, he woke up early and was still burping and not feeling well. At around 5:00am, he collapsed. My mother called 9-1-1 and began giving CPR. The parademics arrived and tried to revive him, and transported him to the hospital but at 6:11am, he was pronounced dead of a heart attack. He was healthy.		No prior vaccinations for this event.

Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease	No prior vaccinations for this event.

progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or

if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

FEELING ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Passed away; tired; nonresponsive; cold; difficulty breathing; swelling; sore arm; feeling weird and funny; A spontaneous report (United States) was received from a consumer concerning a 63 year old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and the patient experienced limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal and the patient passed away . Medical history included treatment for tuberculosis and dialysis. Concomitant medication included calcium acetate, Renvela, glipizide, omeprazole, aspirin, vitamin D, losartan, furosemide, rifampin, and Sensipar. On 14 Jan 2021, the patient received the first of their first planned doses of mRNA-1273 (lot number 030L20A) for prophylaxis of COVID-19 infection. On 13 Jan2021, the patient tested negative for COVID-19). On 16 Jan 2021, the patient experienced a sore arm, and feeling weird/funny. On 17Jan2021, the patient experienced difficulty breathing and swelling. On 18 Jan 2021, the patient declined dialysis, was tired and wanted to lay down. At 8 am, the patient was found nonresponsive and cold and is believed to have passed away around 4 am. The coroner tested the deceased for COVID-19 and the test was positive. No autopsy was reported. No death certificate was issued at the time of the report but the reporter believes it will list cause of death as COVID complications. Action taken with the mRNA-1273 was not applicable. The outcome of the events of limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal, was fatal. On 18 Jan 2021, the patient was died. Cause of death was COVID-19. Autopsy details were not provided.; Reporter's Comments: The events developed on four days after first dose of mRNA-1372. Dyspnea, unresponsive to stimuli, and death were consistent with infection in pandemic set up confounded by age of patient and refusal of dialysis Cause of death was reported as COVID-19. Autopsy details were not provided. Based on reporter's causality the events are assessed as unlikely related to mRNA-1273.; Reported Cause(s) of Death: COVID-19

and patient asked this person to call me and go check on her. Within 5 minutes I was over at her house, and I found her on the floor, she on her belly facedown. It looked like she was on the toilet, and it looked like she fall getting her off, she was still wet, she still felt warm. I called the ambulance and immediately began CPR. When EMS arrived they took over the CPR and transported her to the Hospital. The EMS was there for about 40 minutes and used an machine to preform the compressions. She was pronounced deceased at the hospital. No autopsy was done.

FEELING ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

"My grandpa had a stroke on the 15th of February. He claimed he had been feeling ""off"" for a few days, but didn't say anything. A blood clot had formed in his brain. He was doing better and about to go to rehab to strength his right side of his body. On the 22nd he took a turn for the worst. He was having trouble breathing and they sedated and partially paralyzed him to put a tube in his mouth. I believe another blood clot had formed and oxygen wasn't properly going through his body. They could not stabilize him, and he passed away the same day."

FEELING ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30

Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure

Abdominal pain - diffuse tenderness (right sided) Elevated liver enzymes - likely secondary to dehydration Increased serum creatine kinase - likely due to dehydration		No prior vaccinations for this event.

FIBRIN D DIMER INCREASED	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a	No prior vaccinations for this event.

possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced

pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197,	No prior vaccinations for this event.

creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival

No prior vaccinations for this event.

he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was

diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no

No prior vaccinations for this event.

longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21

FLUID INTAKE REDUCED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient recevied the COVID-19 vaccine on 1/5/21 by the Vaccine clinic #1. Patient tested positive for COVID-19 by rapid testing on 1/6/21. She demonstrated poor appetite and fluid/food intake and an IV of Normal Saline was initiated on 1/7/21. Oxygen saturation was initiated on 1/12/21 at 4L per nasal cannula. for shortness of breath. On 1/22/21 at 0310 Patient was unresponsive and without vital signs. Orders were for DNR and CPR was not initiated.	No prior vaccinations for this event.
FLUID OVERLOAD	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and	No prior vaccinations for this event.

pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib

fractures on the right at ribs 2 through

Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.
FREQUENT BOWEL MOVEMENTS	**COVID19 (COVID19 (PFIZER-BIONTECH))**

(1200)

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310

No prior vaccinations for this event.

MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

FULL BLOOD COUNT

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.	No prior vaccinations for this event.

with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing. this event.

1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19)

arrest and was unable to be resuscitated event.

FULL BLOOD COUNT NORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Patient received Moderna COVID vaccine on 12/30/2020 at a Pharmacy clinic where he was a resident. Nurses at the facility reported that he was responsive and showed no signs of any adverse effects until 1/2/2021 when he was observed slightly unresponsive and staring at the ceiling and trembling. He had a fever of 101F at this time. The facility ordered labs and a rapid COVID test (all of which came back normal) and started IV antibiotics. A few hours later, patient began bleeding from his eyes, nose, and mouth and was sent to the local ER. The patient refused being admitted to the ICU for possible sepsis/hemorrhage and died the following day on 1/3/2021. All healthcare professionals involved agreed that this was not likely due to the vaccine, but needed to be reported nonetheless.

No prior vaccinations for this event.

FULL BLOOD COUNT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident was noted on 1/25 with an increased functional decline as she would not feed herself with utensils, but would eat finger foods if placed in her hand. She was started on Rocephin IM for possible infections. Labs had been obtained on 1/21/21, unremarkable for CBC and CMP. 75,000 colony count on urine. On 1/26/21 she was noted with right sided weakness and further decline. She was sent to Hospital for further evaluation. We were notified that she expired on 1/28/2021. Resident had been noted with a decline in function about 2 weeks earlier when she would not stand or transfer any longer. She was still responsive, taking meds, and feeding herself until 1/26/21. Further information on admitting diagnoses and progress notes from hospital have not been available to date.	No prior vaccinations for this event.
FULL BLOOD COUNT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids	No prior vaccinations for this event.

were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

FUNGAL TEST NEGATIVE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a	No prior vaccinations for this event.

possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced

pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

GAIT INABILITY		**COVID19 (COVID19 (MODERNA)) (1201)**
On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.		No prior vaccinations for this event.

	GAIT INABILITY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."		No prior vaccinations for this event.

Client unexpectedly collapsed and passed away on 1/13/21 from suspected sudden cardiac death. Prior to her death, she was in skilled care for rehabilitation following hospitalization from 12/21-12/31/20 for an acute lower GI bleed. Her hospitalization and skilled care stay were complicated by delirium and she was being		No prior vaccinations for this event.

treated for delirium with olanzapine (Zyprexa) at time of death.

GASTROINTESTINAL HAEMORRHAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29	No prior vaccinations for this event.

more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

GENERAL PHYSICAL CONDITION ABNORMAL

COVID19 (COVID19

	(MODERNA)) (1201)
Around 00:50am on 01/15/21, C.N.A. reported that the resident looked different and not responding. Initiated Code Blue and started CPR. 911 arrived and pronounced resident dead at 1:01 am.	No prior vaccinations for this event.
GENERAL PHYSICAL CONDITION ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Fever Feeling tired short of breath all night and morning after the vaccine My grandma had to be intubated and then passed away to a heart distress we think it was the vaccine because she was fine even with dialysis. When she got the vaccine it took hours and her health conditions changed.	No prior vaccinations for this event.
GENERAL PHYSICAL HEALTH DETERIORATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Accelerated decline in condition with decreased input, decreased responsiveness, somnolence, and death	No prior vaccinations for this event.

Nursing home called 911 for decline in condition. Patient transported to ER where she was admitted to inpatient care and expired 1/30 at 16:13		No prior vaccinations for this event.
	GENERAL PHYSICAL HEALTH DETERIORATION	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.		No prior vaccinations for this event.
	GENERAL PHYSICAL HEALTH DETERIORATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received the Moderna COVID vaccine 1/28/21. He was tested for COVID 19 on 1/29/31. Results were received 1/30/21, at which time he was evaluated and found to be hypoxic with tachycardia. He was sent to the local ER and returned this same day. On 2/2/21, he was evaluated by the provider, who sent him to the		No prior vaccinations for this event.

GENERAL PHYSICAL HEALTH DETERIORATION COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Resident was noted on 1/25 with an increased functional decline as she would not feed herself with utensils, but would eat finger foods if placed in her hand. She was started on Rocephin IM for possible infections. Labs had been obtained on 1/21/21, unremarkable for CBC and CMP. 75,000 colony count on urine. On 1/26/21 she was noted with right sided weakness and further decline. She was sent to Hospital for further evaluation. We were notified that she expired on 1/28/2021. Resident had been noted with a decline

No prior vaccinations for this event.

in function about 2 weeks earlier when she would not stand or transfer any longer. She was still responsive, taking meds, and feeding herself until 1/26/21. Further information on admitting diagnoses and progress notes from hospital have not been available to date.

GENERAL PHYSICAL HEALTH DETERIORATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Approximately 10 minutes after receiving the COVID- 19 vaccine resident displayed seizure activity, staring straight ahead and strong allover muscle jerking of both the up and lower extremities, color became gray, activity lasted approximately 3 minutes, resident then became relaxed, color returned to normal, BP-140/80, 97.8, 60, 16, sleeping the remainder of the shift,. Resident continued to decline until resident CTB on 1/19/21	No prior vaccinations for this event.

GENERAL PHYSICAL HEALTH DETERIORATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in	No prior vaccinations for this event.

2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.

GENERALISED OEDEMA		**COVID19 (COVID19 (MODERNA)) (1201)**
ER visit 1/25/21 patient walked into a prompt care and collapsed, witnessed and pulseless CPR with ROSC after 6-7mins, no shock no meds. Awake and speaking upon arrival to ER. 2 plus pitting edema ble ER diagnosis Anasarca, cardiac arrest, hypotension, elevated troponin I levels, Acute kidney injury and syncope. ER notes reveal a syncopal episode in the shower prior to collapse at prompt care. Central line placed and plan to ship to another facility, patient continued to decline despite dopamine and dobutamine expired in ER prior to transfer.		No prior vaccinations for this event.
GLOBULIN		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.		No prior vaccinations for this event.
GLOBULINS DECREASED		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o		No prior vaccinations

some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT

No prior vaccinations for this event.

revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

GLYCOSYLATED HAEMOGLOBIN

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-

No prior vaccinations for this event.

2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

	GLYCOSYLATED HAEMOGLOBIN INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An		No prior vaccinations

85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19 immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything, nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30 (on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to

for this event.

him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart stopped"		
GRAM STAIN POSITIVE		**COVID19 (COVID19 (MODERNA)) (1201)**
1/24/21 0445- patient presents to the ED with complaints of neck pain, chest pain, and back pain for about a week. States also feels SOB, intermittent fever with temperature 100.3 on arrival. Patient was worked up for his cardiac type symptoms, found to have elevated WBC and CRP with no explanation. D-Dimer was elevated with CT showing no sign of PE. Patient was sent home from the ED with instructions to follow up with primary care and/or return if s/s worsen. 1/24/21 1705- patient is returned to the ED via ambulance after becoming unresponsive and some seizure like activity. Patient was intubated. Head CT showed large brain bleed that was irreparable and not compatible with life. Patient was also found with positive blood cultures x2 with gram positive cocci in clusters growing after 9 hours.		No prior vaccinations for this event.

92 year-old male with PMHx of vascular dementia, BPH, MDD, sleep disturbance , basal cell carcinoma of neck, osteoarthritis, BLE edema, Guillain-Barre syndrome 30 years prior, s/p COVID positive on 1/11/21 and received IV Bamlanivimab. Sent to hospital on 2/2/21 for altered mental status, generalized weakness with inability to lift bilateral UE and difficulty moving his BLE. He was treated for UTI with 7 days of Cefepime for Morganella Morganii. He was followed by neurology with MRI of the brain and CT of the spine without acute findings. Lumbar puncture unable to be obtained. He received 5 day course of IVIG for presumed Guillain-Barre . EMG showed generalized sensory motor polyneuropathy both axon loss and demyelinating type severe in degree. However, he did not recover from his GBS symptoms, was transferred back to the nursing home and died on 2/15/2021.

HAEMATEMESIS

COVID19 (COVID19 (MODERNA))
(1201)

Patient became nauseated about 10 minutes after vaccine administered, this subsided but returned several hours after the vaccine was given. She continued with intractable nausea and vomiting for about 24 hours. This patient was enrolled in hospice and she continued to decline and refused to eat or drink. She was taking Ibuprofen due to intractable back pain. Her emesis was coffee ground color. After this her condition continued to decline until her death

	HAEMATOCRIT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.		No prior vaccinations for this event.
	HAEMATOCRIT DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.		No prior vaccinations for this event.
	HAEMATOCRIT DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.		No prior vaccinations for this event.

HAEMATOCRIT DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.

No prior vaccinations for this event.

HAEMATOCRIT DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on

No prior vaccinations for this event.

hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

HAEMATOCRIT DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021

HAEMATOCRIT DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on

No prior vaccinations for this event.

vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.

HAEMATOCRIT DECREASED	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few	No prior vaccinations for this event.

weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP.

Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

HAEMATOCRIT DECREASED	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37,	No prior vaccinations for this event.

she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

HAEMATOCRIT DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP	No prior vaccinations for this event.

improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th

time at 08:18. Family at beside, Mother asks for code to be stopped."

1/18/2021- Tested positive for Covid-19. 1/20 Patient lethargic, unable to swallow. 1/24 Although 90% O2 sat on RA, it has decreased from her baseline ranging at high 90's. 1/27/2021 Patient passed.	No prior vaccinations for this event.
HAEMATOCRIT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained.	No prior vaccinations for this event.

He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

HAEMATOLOGY TEST	COVID19 (COVID19 (MODERNA)) (1201)
1/24/21 0445- patient presents to the ED with complaints of neck pain, chest pain, and back pain for about a week. States also feels SOB, intermittent fever with temperature 100.3 on arrival. Patient was worked up for his cardiac type symptoms, found to have elevated WBC and CRP with no explanation. D-Dimer was elevated with CT showing no sign of PE. Patient was sent home from the ED with instructions to follow up with primary care and/or return if s/s worsen. 1/24/21 1705- patient is returned to the ED via ambulance after becoming unresponsive and some seizure like activity. Patient was intubated. Head CT showed large brain bleed that was irreparable and not compatible with life. Patient was also found with positive blood cultures x2 with gram positive cocci in clusters growing after 9 hours.	No prior vaccinations for this event.

HAEMATOLOGY TEST	COVID19 (COVID19 (MODERNA)) (1201)
2/2/21-1000-patient presented to the local emergency room with complains of fever, shortness of breath and decreased oxygen sats. temp 101.7, pulse 102, respirations 36, BP 141/92, oxygen 94%. Lung sounds crackles bilaterally with rhonchi on the left. patient worked up for sepsis, CXR shows mild atelectasis. blood pressure dropped, and continued to drop through treatment requiring levophed drop to be initiated. Patient POA determined that this would not be her sister's wishes and made the decision to make patient comfort care status. 2/3/21- patient lethargic throughout night. 0640-patient demise.	No prior vaccinations for this event.

HAEMATOMA	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Resident returned to the memory support unit at 1500. Resident was than toileted and transferred in to bed per his request. At 1515 resident was observed face down beside bed, resident sustained a 1inX1in eccyhmotic/hematoma to the forehead. Neuro Checks with in normal limes Vital signs: 100/52, 100, 97.2,	No prior vaccinations for this event.

28. Resident sent to ED for further medical evaluation via EMS.

HAEMATOMA **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21

No prior vaccinations for this event.

clots. On 2/7/21 there were also lumps noted on left inner thigh. Pt. stopped eating or drinking on 2/8/21 and expired on 2/12/21.

HAEMODIALYSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.	No prior vaccinations for this event.
HAEMODYNAMIC INSTABILITY	**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on	No prior vaccinations for this event.

forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse		
	HAEMODYNAMIC INSTABILITY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt with acute resp failure, COVID PNA, that developed symptoms 9 days prior to admit and ultimately received first vaccine 6 days prior toa admit, then shortly after progressed with other covid symptoms and was admitted. She decompensated while intp and was transferred to ICU for rising O2 needs, ultimately had to be intubated. Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle. Sx and IR consulted and did beside exploration of hematoma. Initially blood pressure responded but overnight continued with refractory hypotension. Maxed out vasopressin and levophed, hemodynamics deteriorated. Pt passed soon after(2/2).		No prior vaccinations for this event.
	HAEMOGLOBIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient		No prior vaccinations for this event.

prior to lab company arrival.

	HAEMOGLOBIN DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.		No prior vaccinations for this event.

HAEMOGLOBIN DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with	No prior vaccinations for this event.

hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

HAEMOGLOBIN DECREASED	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy,	No prior vaccinations for this event.

and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted

the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

HAEMOGLOBIN DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care	No prior vaccinations for this event.

center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer,	No prior vaccinations for this event.

however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost

No prior vaccinations for

consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 this event. on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures

consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with

No prior vaccinations for this event.

IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."

HAEMOGLOBIN DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt received dose #1 of COVID-19 vaccine (Pfizer-BioNTech) on 12/18/20 and dose #2 (Pfizer-BioNTech) on 1/8/21. On 1/30, patient was evaluated at urgent care due to back pain. No bloodwork done; metronidazole prescribed for 7 days. On 2/8, patient was admitted to outside hospital due to ongoing symptom progression. At time of admission, hgb 5 g/dL and plt 9k. Per Dr. (hematology/oncology), pt with schistocytes, LDH 1500, and elevated reticulocyte count consistent with thrombotic thrombocytopenic purpura (TTP). SCr >2 mg/dL. Patient immediately treated with plasma exchange and steroids, however continued to decline. Patient expired on 2/14/21.	No prior vaccinations for this event.
HAEMOGLOBIN DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received dose #1 of COVID-19 vaccine on 1/16/21. Within 3 days, she developed petechiae up to ankles, later rising up to her knees. Pt admitted to hospital on 2/6/21 for symptomatic anemia 2/2 vaginal bleeding. Patient received 4 units FFP, 4 units PRBC, 1 unit cryoprecipitate, and vitamin K 5 mg IV. Also started on medroxyprogesterone 20 mg PO TID. Alectinib d/ced due to worsening liver function. Evalauted by OB/GYN and Hematology. Diagnosed with DIC. Patient with worsening bilateral lower extremity edema	No prior vaccinations for this event.

and purpura with pain and weakness. Palliative care consulted. Patient passed away on 2/11.

HAEMOGLOBIN DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/12/2021 Vaccine 2/13/2021 Weakness, oral ulcers 2/17/2021 Brought to ER for loss of consciousness, altered mental status, rectal bleeding; work up showed sepsis, UTI, anemia, pneumonia, pleural effusion, pancytopenia, hypotension; persistent hypotension and respiratory failure 2/18/2021 Passed away at 5:54AM	No prior vaccinations for this event.
HAEMOGLOBIN INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).	No prior vaccinations for this event.

floor and hallway rug.

	HAEMORRHAGE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received the vaccine on 1/31/2021. Patient complained of bleeding 2/7/2021. Went to clinic where labs were conducted. Patient had an INR of 12. Previous INR results were normal prior to vaccination. Patient was also diagnosed with UTI and given antibiotics. Patient was encouraged to go to ER. Patient died on 2/12/2021.		No prior vaccinations for this event.
	HAEMORRHAGE	**COVID19 (COVID19 (MODERNA)) (1201)**
Case passed away on 2/28/21. During post vaccination monitoring, case did not have any adverse reactions. When writer spoke to him on 2/26/21 to schedule his second dose, he sounded well.		No prior vaccinations for this event.
	HAEMORRHAGE	**COVID19 (COVID19 (MODERNA)) (1201)**
Passed away; UTI; Abnormal bleeding; A spontaneous report was received from a healthcare professional concerning a patient who received the Moderna COVID-19 Vaccine (mRNA-1273) and experienced abnormal bleeding, UTI, and passed away. The patient's medical history included a long term history of anticoagulation therapy. Concomitant product use included anticoagulation therapy. On 31Jan2021 prior to the onset of the events the patient recieved their first dose of mRNA-1273 (Lot number:not reported) intramuscularly for prophylaxis of COVID-19 infection. On 07Feb2021, the patient complained of abnormal bleeding. Patient was seen at clinic on 10Feb2021 and was diagnosed with a UTI and given antibiotics. An INR was also completed that day due to patient having a long term history of anticoagulation therapy. Results of that showed the INR to be 12. Prior to vaccination, patient's INR was normal and no changes to medications and diet were made after vaccination and prior to complaint starting. On 12Feb2021 the patient passed away. Action taken with		No prior vaccinations for this event.

mRNA-1273 in response to the events was not applicable. The patient died on 12Feb2021. The cause of death was unknown. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns an 82 year old male patient, with history of long term anticoagulation therapy (unknown indication), who experienced a fatal event of death and abnormal hemorrhage, 13 days after receiving second dose of mRNA-1273 (Lot# Unknown). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

	HAEMORRHAGE	**COVID19 (COVID19 (MODERNA)) (1201)**
Death within 30 days: Admit 2/8/21-2/13/21 s/p fall with left hip fracture (repaired), severe debility with recurrent falls discharged to SNF. Not doing well postop at the SNF, brought to ED due to failed foley insertion with bright red blood upon arrival to ER febrile, hypotensive, tachycardic, severe sepsis. Gran negative bacteremia likely from chronic ascites, family decided on comfort care and he expired within hours of admission.		No prior vaccinations for this event.
	HAEMORRHAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient (now deceased) received 1st dose of Pfizer-BioNTech vaccine around December 21, 2020 and was noticed to be scratching, fatigued, and unresponsive by a family member on December 24, 2020. He received the second dose of the same vaccine around January 22, 2021. Pockmarks and bleeding scratch marks were noted by a family member on the patient's face prior to this second dose. On January 28, 2021 a family member was alerted that the patient was suffering from severe bullous pemphigoid- a skin condition that has never been experienced by the patient, has been reported to be related to COVID-19 viral infection, and to T-cell responses promoted by vaccines. A corticosteroid was given, but did not work. Blisters developed to the point hands had to be dressed.		No prior vaccinations for this event.

	HAEMORRHAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
L hand edema, hematoma which burst and caused bleeding sending pt to the ER for pressure dressing and 2 stitches. L hand and arm progressively got more edematous and bruised looking (severely black/blue/purple) and the hand continued to bleed and swell on 2/6/21. Severe arterial and venous issues and apparent blood clots. On 2/7/21 there were also lumps noted on left inner thigh. Pt. stopped eating or drinking on 2/8/21 and expired on 2/12/21.		No prior vaccinations for this event.

HEAD DISCOMFORT

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing

COVID19 (COVID19 (MODERNA)) (1201)

Headache, pain in the injection site, threw up. A few hours later she died. No prior vaccinations for this event.

HEADACHE **COVID19 (COVID19 (MODERNA)) (1201)**

My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.

No prior vaccinations for this event.

HEADACHE **COVID19 (COVID19 (MODERNA)) (1201)**

on 1/13/2021 at 3:40am Cliff called for assistance. He lost his balance and had fallen. Cliff refused vitals, refused emergency department, denied hitting his head. As the day progressed patient developed a headache, diarrhea, and vomiting. He again declined the offer for the emergency room. At supper time wife and staff found Cliff unresponsive, 911 was called and he was taken to the emergency department. The ER did a CT scan and found an acute subdural hematoma. Patient was placed on comfort cares and expired at 3pm on 01/14/2021. Cliff did not have a history of falls.

Influenza vaccine 10/06/2020, age 88, fever, chills, vomiting, malaise

HEADACHE **COVID19 (COVID19 (MODERNA)) (1201)**

On 1/23/21 the patient had a single-car accident, slid off icy road into snowbank. She was seen in our ER, diagnosed w/ trauma and L4 compression fracture. She was transported to Hospital for further trauma workup. We believe she was treated and released. On 1/31/21 the patient had a headache but did not seek medical attention. In the morning of 2/1 she became unresponsive and was pronounced dead on the scene when EMS arrived. Autopsy showed a left temporal subdural hematoma.

No prior vaccinations for this event.

HEADACHE

COVID19 (COVID19 (MODERNA)) (1201)

Patient presented to emergency room on 2/1/2021 with a chief complaint of having a chronic headache and fatigue following receipt of the Moderna vaccine 10 days prior. Following examination by the physician, the patient was diagnosed with an acute subdural hematoma. The patient subsequently underwent decompressive surgery, however demonstrated worsening neurologic status over the next several days and ultimately expired on 2/4/2021.

No prior vaccinations for this event.

HEADACHE

COVID19 (COVID19 (MODERNA)) (1201)

No prior vaccinations for this event.

HEADACHE

COVID19 (COVID19 (MODERNA)) (1201)

Almost immediate headache per wife. Developed fever around 4 pm. Headache all day. Took Tylenol at 4 and 10 pm. Gradual development of SOB and cough. Temp of 101.4 at 10 pm. pulse ox 92% at 10 pm. Went to sleep, woke up at 0050 with increasing SOB. Pulse ox 82%. Used albuterol inhaler, wife called emergency services at 0113. EMS arrived around 0130 to patient's home. pulse ox 86%, coughing, sob, hard time breathing. Walked to stretcher. Became unresponsive. Found to have no pulse, stopped breathing. CPR

No prior vaccinations for this event.

initiated at about 0140. King airway placed in field, I/O in left tibia. Patient from PEA to asystole, to vfib, to asystole. ACLS followed. Unrecoverable asystole and patient time of death 0213.

	HEADACHE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient had the first Moderna Covid vaccine on Thursday 1/21/2021. She had a bit of sore arm on that day and the day after. On Saturday 1/23/2021, she had a fever of 100.5 F (11AM), nausea, light headache and chills. The temperature went down after she took ibuprofen. Patient's husband enrolled her to V-Safe to report all the adverse effects she experienced. On Sunday 1/24/2021, her temperature was 98.3F. She still had nausea and no appetite. She and her husband watched a football game in their bedroom upstairs. Husband noticed that his wife was pacing around the room many times. At 7Pm, Husband went downstairs for dinner but she refused to come down to eat. He went upstairs around 8pm, TV was still on. He turned off TV and went down stairs again thinking his wife felt as sleep while watching TV. He went back upstairs for bed around 10:30 PM. Husband said his wife had a deviated septum so she would snore very loudly when asleep. He didn?t hear her snoring so he went to check on her and found her not responsive. Husband called emergency services. Paramedic came at 10:45 and said patient was passed. Husband sent many texts to V-safe after that to report the incident. No response was received from V-safe. Patient?s doctor told her husband that she died due to cardiac arrest.		No prior vaccinations for this event.

2/12/2021 woke up with sore arm and back. 2/13/2021 woke up with headache around 1am. Headache and nausea all morning. Mid-late afternoon started having seizures. Admitted to Hospital 2/15/2021 expired. Reported per wife on 2/25/2021.		No prior vaccinations for this event.
HEADACHE		**COVID19 (COVID19 (MODERNA)) (1201)**
Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right		No prior vaccinations for this event.

arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

She had the first dose of Pfizer vaccine at the Campus on Friday 1/15 at 4:30 pm. After the vaccine, she had no new symptoms or signs of vaccine reaction and MD friend reports that he checked her pulse which was not elevated from baseline. On 1/16, she awakened and continued to feel at her recent baseline. However, in the early afternoon, she complained of headache, nausea/epigastric pain, and chest heaviness. These apparently were not unusual symptoms for her to feel intermittently. Per her niece, who has a home O2 sat device, her 02 sat that morning was 97 with a HR of 87 irregularly irregular. She was afebrile. (continue on page 2)

and initially called in to work. He then decided to come to work and was found down in a patient bathroom during his shift on our Facility while taking care of a patient (he was a nurse aid). Patient was coded and the team and was transferred to our Facility ED. He expired 3/3 2112		this event.
	HEADACHE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Day After - severe headache, 2 days after headache continues, itchy scalp, day 3 rash visible at hair line headache continues, more confusion than normal, day 4 on site nurses check rash and think it is dermatitis, day 5 continues to get work nurse practitioner was to visit next day, day 6 NP thinks that she has UTI and sends her to hospital (2/11/21). Hospital determines - Rash is Shingles, UTI present, - MRSA is now present in shingles which is on right back of head and right neck and face. Next Sepsis is diagnosed. Since 2/11/21 patient was not conscious. 2/20/21 famiy is notified that she should be moved to Hospice. Moved to hospice on 2/20/21. The patient, my mother, died on 2/23/21 official cause of death is UTI.		No prior vaccinations for this event.
	HEART RATE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Is patient deceased: Yes; Low pulse; This is a spontaneous report from two contactable nurses reporting for a patient. A 70-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL0140 expiration date Mar2021) intramuscular on 22Dec2020 at 10:30 at single dose in right arm for COVID-19 immunisation. The patient was vaccinated at Nursing Home. Patient age at time of vaccination was 70 years. Patient's Medical History included ongoing Type 2 Diabetes Mellitus Without Complication onset date: admission 22Oct2020, ongoing morbid obesity due to excess calories onset date: admission 22Oct2020, cardiac disorder, essential hypertension, hypertension, schizophrenia,		No prior vaccinations for this event.

hyperlipidemia, benign prostatic hyperplasia (BPH), Gastrooesophageal reflux disease (GERD), depression, hypothyroid, epilepsy, pain, dry eyes, anxiety, restlessness, 17Jan2020 Slid out of chair to floor, no injury, on 27Jan2020, 28Jan2020, 29Jan2020 diarrhea noted. Concomitant medications included acetylsalicylic acid (ASPIRIN EC) for Cardiac Health, atenolol (ATENOLOL) for Essential Hypertension, atorvastatin calcium (ATORVASTATIN CALCIUM) for hyperlipidemia, finasteride (FINASTERIDE) for benign prostatic hyperplasia, tamsulosin hydrochloride (FLOMAX) benign prostatic hyperplasia, insulin glargine (LANTUS) for diabetes mellitus, lithium carbonate (LITHIUM CARBONATE) for Schizophrenia, losartan potassium (LOSARTAN POTASSIUM) for hypertension, lurasidone hydrochloride (LURASIDONE HYDROCHLORIDE) for Schizophrenia, omeprazole (OMEPRAZOLE) for gastrooesophageal reflux disease, sertraline hcl (SERTRALINE HCL) for depression, levothyroxine sodium (SYNTHROID) for hypothyroid, ergocalciferol (VIT D) for supplement, haloperidol (HALOPERIDOL) for Schizophrenia, levetiracetam (KEPPRA) for epilepsy, paracetamol (TYLENOL EXTRA-STRENGTH) for pain, propylene glycol (ARTIFICIAL TEARS) for dry eyes, lorazepam (ATIVAN) for a anxiety or restlessness. As antipyretic use was reported Tylenol ES (500 mg) Tab, 2 Tabs by Mouth Routine use three times a day given at time of vaccination and after. It was reported the patient was Covid+. He was tested on 21Dec2020 and was not admitted to hospital. Event Onset Date was reported as 24Dec2020 (clarification pending). On 30Dec2020 the patient was started on O2 at 2L for low pulse. O2 was increased over time to eventually O2 at 8L on 03Jan2021. Morphine Sulfate was started on 03Jan2021 at 5 mg sl/by mouth every 2 hours as needed for pain or airhunger. The patient deceased on 03Jan2021. The cause of death was unknown. It was not reported if an autopsy was performed. The AEs did not require a visit to Emergency Room or Physician Office. Outcome of Low pulse was unknown.; Sender's Comments: Based on the information available the events Death (unknown cause) and Heart rate decreased are attributed to patient's multiple underlying medical conditions including Type 2 Diabetes Mellitus, morbid obesity, cardiac disorder, hypertension, epilepsy etc. However, based solely on a vaccine-event chronological association, contributory role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to the above mentioned events cannot be completely excluded. The case will be reevaluated should additional information, including the cause of death, become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as

part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Is patient deceased: Yes

HEART RATE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on 17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They	No prior vaccinations for this event.

decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

HEART RATE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Maternal exposure during pregnancy; Fetus stopped growing on 09Feb21 (8w4d); no heartbeat detected; This is a spontaneous report from a contactable consumer (parent). This consumer reported information for both mother and fetus. This is a fetus report. A patient of unspecified age and gender (fetus) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9269), transplacental on 04Feb2021 at 14:00 at single dose for COVID-19 immunisation. The patient medical history was not reported. Concomitant medication included ergocalciferol (VIT D), folic acid (FOLATE), ascorbic acid/betacarotene/calcium sulfate/colecalciferol/cyanocobalamin/ferrous fumarate/folic acid/ nicotinamide/pyridoxine hydrochloride/retinol acetate/riboflavin/thiamine mononitrate/tocopheryl acetate/zinc oxide (PRENATAL VITAMINS) and sertraline hydrochloride (ZOLOFT) at 25 mg, all transplacental. It was reported that OB exam on 03Feb21 showed healthy baby at 7weeks 5days heartbeat detected 152 bpm; no abnormalities identified via ultrasound; labs and hormone levels all within normal ranges. No issues detected. Mother received 1st dose of vaccine on 04Feb2021. Per ultrasound on 20Feb2021, fetus stopped growing on 09Feb2021 (8 weeks 4 days); no heartbeat detected. Miscarriage occurred on 22Feb2021. The fetus died on 22Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021204433 same drug and reporter, different patient and event; Reported Cause(s) of Death: Fetus stopped growing on 09Feb21 (8w4d); no heartbeat detected; Mother received 1st dose of vaccine 04Feb21. Per ultrasound on 20Feb21, fetus stopped growing on 09Feb21 (8w4d); no heartbeat detected. Miscarriage occurred 22Feb21.	No prior vaccinations for this event.

	HEART RATE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
pulmonary edema; Low heart rate; chest pain; This is a spontaneous report from a contactable pharmacist. An 80-years-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left arm on 28Jan2021 at single dose for COVID-19 Immunisation. Medical history included dementia, high blood pressure, COVID prior vaccination. He had no known allergies. Concomitant medication included diltiazem hydrochloride (CARDIZEM), anastrozole (ARIMIDEX), simvastatin and lorazepam. Historical Vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 07Jan2021 (at the age of 80-years-old) at single dose for COVID-19 Immunization. There was no other vaccine received in four weeks. The patient experienced pulmonary edema, low heart rate and chest pain on 26Feb2021. The events resulted in hospitalization and patient died. The patient was hospitalized from 26Feb2021 for 1 day. Treatment received for the events included Epinephrine, morphine, nitroglycerine. The patient underwent lab tests and procedures which included Covid test Nasal Swab post vaccination on 26Feb2021 indicated Negative. The patient died on 26Feb2021. An autopsy was not performed. information on the lot/batch number has been requested.; Sender's Comments: Pulmonary edema, low heart rate, and chest pain, all reported as fatal, are deemed unrelated to BNT162B2 vaccine, being rather accidental occurrences, likely favored by the patient's age and by the mentioned high blood pressure, known risk factor for cardiovascular diseases. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Low heart rate; pulmonary edema; chest pain		No prior vaccinations for this event.

HEART RATE ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received vaccine at Public Health Clinic. Patient ended up having a seizure 3 days later and ended up in the hospital. Found to have right lobe pneumonia and low depakote level. Patient noted to have multiple seizures at hospital, issues with stabilizing HR and BP, and passed away on 1/20/21.	No prior vaccinations for this event.
HEART RATE ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Decedent had unwitnessed fall out of wheelchair 1/25/21 around 9:43am, denied head strike, pain, discomfort. Around 10:02pm, 1/25/21, decedent noted to have slurred speech and fluctuating HR, transported to Hospital and made cmo.	No prior vaccinations for this event.
HEART RATE DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Is patient deceased: Yes; Low pulse; This is a spontaneous report from two contactable nurses reporting for a patient. A 70-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL0140 expiration date Mar2021) intramuscular on 22Dec2020 at 10:30 at single dose in right arm for COVID-19 immunisation. The patient was vaccinated at Nursing Home. Patient age at time of vaccination was 70 years. Patient's Medical History included ongoing Type 2 Diabetes Mellitus Without Complication onset date: admission 22Oct2020, ongoing morbid obesity due to excess calories onset date: admission 22Oct2020, cardiac disorder, essential hypertension, hypertension, schizophrenia,	No prior vaccinations for this event.

hyperlipidemia, benign prostatic hyperplasia (BPH), Gastrooesophageal reflux disease (GERD), depression, hypothyroid, epilepsy, pain, dry eyes, anxiety, restlessness, 17Jan2020 Slid out of chair to floor, no injury, on 27Jan2020, 28Jan2020, 29Jan2020 diarrhea noted. Concomitant medications included acetylsalicylic acid (ASPIRIN EC) for Cardiac Health, atenolol (ATENOLOL) for Essential Hypertension, atorvastatin calcium (ATORVASTATIN CALCIUM) for hyperlipidemia, finasteride (FINASTERIDE) for benign prostatic hyperplasia, tamsulosin hydrochloride (FLOMAX) benign prostatic hyperplasia, insulin glargine (LANTUS) for diabetes mellitus, lithium carbonate (LITHIUM CARBONATE) for Schizophrenia, losartan potassium (LOSARTAN POTASSIUM) for hypertension, lurasidone hydrochloride (LURASIDONE HYDROCHLORIDE) for Schizophrenia, omeprazole (OMEPRAZOLE) for gastrooesophageal reflux disease, sertraline hcl (SERTRALINE HCL) for depression, levothyroxine sodium (SYNTHROID) for hypothyroid, ergocalciferol (VIT D) for supplement, haloperidol (HALOPERIDOL) for Schizophrenia, levetiracetam (KEPPRA) for epilepsy, paracetamol (TYLENOL EXTRA-STRENGTH) for pain, propylene glycol (ARTIFICIAL TEARS) for dry eyes, lorazepam (ATIVAN) for a anxiety or restlessness. As antipyretic use was reported Tylenol ES (500 mg) Tab, 2 Tabs by Mouth Routine use three times a day given at time of vaccination and after. It was reported the patient was Covid+. He was tested on 21Dec2020 and was not admitted to hospital. Event Onset Date was reported as 24Dec2020 (clarification pending). On 30Dec2020 the patient was started on O2 at 2L for low pulse. O2 was increased over time to eventually O2 at 8L on 03Jan2021. Morphine Sulfate was started on 03Jan2021 at 5 mg sl/by mouth every 2 hours as needed for pain or airhunger. The patient deceased on 03Jan2021. The cause of death was unknown. It was not reported if an autopsy was performed. The AEs did not require a visit to Emergency Room or Physician Office. Outcome of Low pulse was unknown.; Sender's Comments: Based on the information available the events Death (unknown cause) and Heart rate decreased are attributed to patient's multiple underlying medical conditions including Type 2 Diabetes Mellitus, morbid obesity, cardiac disorder, hypertension, epilepsy etc. However, based solely on a vaccine-event chronological association, contributory role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to the above mentioned events cannot be completely excluded. The case will be reevaluated should additional information, including the cause of death, become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as

part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Is patient deceased: Yes

	HEART RATE DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
	pulmonary edema; Low heart rate; chest pain; This is a spontaneous report from a contactable pharmacist. An 80-years-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left arm on 28Jan2021 at single dose for COVID-19 Immunisation. Medical history included dementia, high blood pressure, COVID prior vaccination. He had no known allergies. Concomitant medication included diltiazem hydrochloride (CARDIZEM), anastrozole (ARIMIDEX), simvastatin and lorazepam. Historical Vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 07Jan2021 (at the age of 80-years-old) at single dose for COVID-19 Immunization. There was no other vaccine received in four weeks. The patient experienced pulmonary edema, low heart rate and chest pain on 26Feb2021. The events resulted in hospitalization and patient died. The patient was hospitalized from 26Feb2021 for 1 day. Treatment received for the events included Epinephrine, morphine, nitroglycerine. The patient underwent lab tests and procedures which included Covid test Nasal Swab post vaccination on 26Feb2021 indicated Negative. The patient died on 26Feb2021. An autopsy was not performed. information on the lot/batch number has been requested.; Sender's Comments: Pulmonary edema, low heart rate, and chest pain, all reported as fatal, are deemed unrelated to BNT162B2 vaccine, being rather accidental occurrences, likely favored by the patient's age and by the mentioned high blood pressure, known risk factor for cardiovascular diseases. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as	No prior vaccinations for this event.

appropriate.; Reported Cause(s) of Death: Low heart rate; pulmonary edema; chest pain

induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

HEART RATE IRREGULAR		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient found down at home with agonal respirations and per EMS asystole, received 2 rounds of epi at her house with return of spontaneous pulses, lost pulse again in route to ER and another round of epi was given, CPR in progress when arrived at hospital. Prior to this patient's husband states he heard her fall in the bathroom but did not immediately check on her as he states that this has happened before. He checked on her 10 min later and that's when he found her unconscious. Daughter called 911 and she began CPR. No previous complaints of headache, chest pain, back pain, fever or chills. Husband states patient was drinking that evening which is not unusual for her. Patient died at hospital.	No prior vaccinations for this event.	
HEART RATE IRREGULAR		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
She had the first dose of Pfizer vaccine at the Campus on Friday 1/15 at 4:30 pm. After the vaccine, she had no new symptoms or signs of vaccine reaction and MD friend reports that he checked her pulse which was not elevated from baseline. On 1/16, she awakened and continued to feel at her recent baseline. However, in the early afternoon, she complained of headache, nausea/epigastric pain, and chest heaviness. These apparently were not unusual symptoms for her to feel intermittently. Per her niece, who has a home O2 sat device, her 02 sat that morning was 97 with a HR of 87 irregularly irregular. She was afebrile. (continue on page 2)	No prior vaccinations for this event.	

	HEART RATE IRREGULAR	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.		No prior vaccinations for this event.
	HEART SOUNDS ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
No adverse effects noted after vaccination. Patient with cardiac history was found unresponsive at 16:45 on 1/6/21. Abnormal breathing patterns, eyes partially closed SPO2 was 41%, pulseless with no cardiac sounds upon auscultation. CPR and pulse was regained and patient was breathing. Patient sent to Hospital ER were she remained in an unstable condition had multiple cardiac arrest and severe bradycardia and in the end the hospital was unable to bring her back.		No prior vaccinations for this event.
	HEMIPARESIS	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient vaccinated on 12/28. Approximately one day later, develops cough and on azithromycin x 1 week. On 1/3, patient develops left-sided weakness and aphasia. Taken to the hospital, tested COVID+, required intubation -- acute hypoxic respiratory failure secondary to COVID - on H&P. Patient died on 1/4/21 at 7:20am.		No prior vaccinations for this event.

	HEMIPARESIS	**COVID19 (COVID19 (MODERNA)) (1201)**
death; hemiparesis; respiratory failure; Aphasia; SARS-COV-2 test positive; cough; A spontaneous report was received from other health care professional concerning a 32- year -female patient who received Modena's COVID-19 vaccine (mRNA-1273) and experienced aphasia, cough, death, endotracheal intubation, hemiparesis, respiratory failure and SARS-COV-2 tested positive. The patient's medical history was not provided. No relevant concomitant medications were reported. On 28-Dec-2020, the patient received their first of two planned doses of mRNA-1273 (lot/batch 039k20A) intramuscularly on left arm for prophylaxis of COVID-19 infection. Approximately, one day later, patient developed cough and on treatment with azithromycin for one week. On 03-jan-2021, she experienced left sided weakness and aphasia and was shifted to hospital. Patient was confirmed COVID-19 positive which required intubation for acute hypoxic respiratory failure secondary to COVID-19. No laboratory data was provided. Action taken with mRNA-1273 in response to the events aphasia, cough, death, endotracheal intubation, hemiparesis, respiratory failure and SARS-COV-2 tested positive not applicable. On an unknown date, the outcome of the events aphasia, cough, death, endotracheal intubation, hemiparesis, respiratory failure and SARS-COV-2 tested positive was fatal. On 04 Jan 2021, the patient passed away due to the unknown cause. Autopsy results were unknown.; Reporter's Comments: Very limited information regarding this event has been provided at this time. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the event of COVID-19 is assessed as unlikely related. The cause of death was not reported. Autopsy results were unknown.; Reported Cause(s) of Death: Unknown cause of death		No prior vaccinations for this event.
	HEMIPARESIS	**COVID19 (COVID19 (MODERNA)) (1201)**
"My grandpa had a stroke on the 15th of February. He claimed he had been feeling ""off"" for a few days, but didn't say anything. A blood clot had formed in his brain. He was doing better and about to go to rehab to strength his right side of his body. On the 22nd he took a turn for the worst. He was having trouble		No prior vaccinations for this event.

breathing and they sedated and partially paralyzed him to put a tube in his mouth. I believe another blood clot had formed and oxygen wasn't properly going through his body. They could not stabilize him, and he passed away the same day."

	HEMIPARESIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Has underlying dementia and often with difficulty eating. 1 week after immunization she developed a stroke with left sided weakness and difficulty swallowing. Comfort measures instituted. Not sure if this is related to the vaccine, but thought I should report		No prior vaccinations for this event.

	HEMIPARESIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident was noted on 1/25 with an increased functional decline as she would not feed herself with utensils, but would eat finger foods if placed in her hand. She was started on Rocephin IM for possible infections. Labs had been obtained on 1/21/21, unremarkable for CBC and CMP. 75,000 colony count on urine. On 1/26/21 she was noted with right sided weakness and further decline. She was sent to Hospital for further evaluation. We were notified that she expired on 1/28/2021. Resident had been noted with a decline in function about 2 weeks earlier when she would not stand or transfer any longer. She was still responsive, taking meds, and feeding herself until 1/26/21. Further information on admitting diagnoses and progress notes from hospital have not been available to date.		No prior vaccinations for this event.

	HEMIPARESIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Adverse reaction to the vaccine started with variable weakness beginning 1/29/2021. On 1/30/21 around 8:30pm, he needed assistance in the bathroom related to weakness and had what was later identified as a stroke with left side weakness and slurred speech. In accordance with his wishes, he had care at home. Due to his advanced age and frailty, a CT scan was not pursued. The 325 mg of aspirin that he was previously taking daily was discontinued. After the stroke, he needed total care. Hospice was established at home. Nursing assistant care was delivered by daughter. Death followed 9 days later (2/9/2021).

No prior vaccinations for this event.

HEMIPLEGIA

COVID19 (COVID19 (MODERNA)) (1201)

Staff walked into resident's room around 10:00am and noted resident's left side of his face was flaccid. Nurse was called and upon assessment resident noted to have an unequal hand grasp with left worse. He was able to talk but was mumbled and hard to understand. Physician, hospice, and family were notified. Resident had a stroke at 10:06 am on 1/8/2020. He lost all ability to use his left side. Resident passed away on 1/11/2020.

"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia

No prior vaccinations for this event.

(80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

HEPATIC FUNCTION ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received dose #1 of COVID-19 vaccine on 1/16/21. Within 3 days, she developed petechiae up to ankles, later rising up to her knees. Pt admitted to hospital on 2/6/21 for symptomatic anemia 2/2 vaginal bleeding. Patient received 4 units FFP, 4 units PRBC, 1 unit cryoprecipitate, and vitamin K 5 mg IV. Also started on medroxyprogesterone 20 mg PO TID. Alectinib d/ced due to worsening liver function. Evalauted by OB/GYN and Hematology. Diagnosed with DIC. Patient with worsening bilateral lower extremity edema and purpura with pain and weakness. Palliative care consulted. Patient passed away on 2/11.	No prior vaccinations for this event.
HEPATORENAL SYNDROME	**COVID19 (COVID19 (MODERNA)) (1201)**

Hepatorenal syndrome- Death No prior vaccinations for this event.

HERNIA REPAIR	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**	
Vaccinated 2/20. At that time, had symptoms of incarcerated hernia, went to ED for evaluation. Not felt to warrant hospital admission. Returned two days later with agitation, altered mental status, and incarceration. Went to OR, uncomplicated hernia repair. Postoperatively, did not recover mental status. Went into arrythmias POD 4, hypotension ensued, had multiple interventions and evaluations without satisfying answers for clinical course.		No prior vaccinations for this event.
HERPES ZOSTER		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On 1/29/21 patient began not feeling well and saw her provider. The doctor gave her fluids and tramadol for pain. They noticed increased confusion, but thought that could have been due to the tramadol. They also increased her gabapentin as she was experiencing nerve pain. Patient also developed a rash and was diagnosed with shingles on 2/1/21. Patient died on 2/3/21		No prior vaccinations for this event.
HERPES ZOSTER		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Day After - severe headache, 2 days after headache continues, itchy scalp, day 3 rash visible at hair line headache continues, more confusion than normal, day 4 on site nurses check rash and think it is dermatitis, day 5 continues to get work nurse practitioner was to visit next day, day 6 NP thinks that she has UTI and sends her to hospital (2/11/21). Hospital determines - Rash is Shingles, UTI present, - MRSA is now present in shingles which is on right back of head and right neck and face. Next Sepsis is diagnosed. Since 2/11/21 patient was not conscious. 2/20/21 famiy is notified that she should be moved to Hospice. Moved to hospice		No prior vaccinations for this event.

on 2/20/21. The patient, my mother, died on 2/23/21 official cause of death is UTI.

	HIATUS HERNIA	**COVID19 (COVID19 (MODERNA)) (1201)**
"Resident complained of feeling ""hot"" at supper time. Had emesis an hour or so later. Became hypoxic and was transferred to the hospital emergency room. Her evaluation in the ED revealed continued presence of UTI, leukocytosis (19.8), and renal insufficiency (BUN 22 Cr. 1.3) BP 99/63; P 74; Temp 98.1; RR 16; and O2 sat of 95% with 2 LPNC (she is typically on RA). CXR reported changes most consistent with CHF with cardiomegaly and bilateral pulmonary vascular prominence. Bibasilar pleural effusions greater on the right than left with pulmonary edema. Large hiatal hernia and likely old chronic wedge defromities involving the mid thoracic vertebral body. She was admitted for IV antibiotics. She expired 2/6/2021"		No prior vaccinations for this event.

	HIATUS HERNIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at		No prior vaccinations for this event.

01:53 on 1/19/21.

HIP ARTHROPLASTY	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient fell the day after receiving the Moderna COVID-19 vaccine. She broke her hip in this fall. During surgery to correct the broken hip, she went in to sudden and unexpected cardiac arrest. The anesthetist did not notice any ST changes or A fib; dysrhythmia was very unexpected. The patient had a DNR. She died at 13:00 on 02/07/2021. Causes of death are listed as 1. Cardiac Arrest 2. Recent hip fracture with hip placement 3. History of Breast Cancer 4. Hypothyroid and 5. Dementia	No prior vaccinations for this event.
HIP FRACTURE	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident had body aches, a low O2 sat and had chills starting on 12/30/20. He had stated that they had slightly improved. On 1/1/21 he sustained a fall with a diagnosis of a displaced hip fracture. On 1/2/21 during the NOC shift his O2 sat dropped again. He later went unresponsive and passed away.	No prior vaccinations for this event.
HIP FRACTURE	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient fell the day after receiving the Moderna COVID-19 vaccine. She broke her hip in this fall. During surgery to correct the broken hip, she went in to sudden and unexpected cardiac arrest. The anesthetist did not notice any ST changes or A fib; dysrhythmia was very unexpected. The patient had a DNR. She died at 13:00 on 02/07/2021. Causes of death are listed as 1. Cardiac Arrest 2. Recent hip fracture with hip placement 3. History of Breast Cancer 4. Hypothyroid and 5. Dementia	No prior vaccinations for this event.
HIP FRACTURE	**COVID19 (COVID19**

	(MODERNA)) (1201)
Approximately 2 weeks after the first COVID vaccine she developed shortness of breath that was much more significant than she had previously. This was the first time she had expressed this symptom to me as being something she was concerned about and difficult for her to manage (we have spoken almost daily for many years). Within 24 hours of the second dose of the mRNA vaccine, they called an ambulance to get her and she was taken to the hospital and diagnosed with bacterial pneumonia. The doctors said it was unrelated, but I found a study with a different vaccine (LAIV) that also seemed to increase the incidence of bacterial pneumonia. They hypothesized through diverting the immune system. So while I don't think the vaccine gave her the bacteria, I do think it may have caused her immune system to be temporarily compromised allowing the bacteria to grow out of control. I feel this is important to report to look for these types of patterns as perhaps it can help others avoid the death spiral that happened to my mother. There were also intervening events between her hospitalization and her death including two successful surgeries (one for a broken hip and another to put in stents in her leg). So to summarize, the first vaccine was within about 2 weeks of the onset of her breathing problems. Within 24 hours of the second vaccine she was hospitalized and diagnosed with bacterial pneumonia. As she was battling bacterial pneumonia in the hospital she broke her hip and was found to have reduced peripheral circulation and had 2 surgeries to correct those. They were successful according to the surgeons, however she died within a week or so of the surgeries. She had other comorbidities as well which I'm sure predisposed her such as diabetes, hypertension and cancer for many years.	Breathing issues ~2 weeks after first dose of mRNA vaccine in the series but were not nearly as acute or severe as they were fol

HOSPICE CARE

COVID19 (COVID19 (PFIZER-BIONTECH))

(1200)

Resident was vaccinated on 12/31/20. Then on 1/14/21 he tested positive for SARS-CoV-2 on routine surveillance PCR testing. Another resident on the same hall was COVID positive on 1/11/21. Results of the PCR test were obtained on 1/16/21. He appeared asymptomatic at that time. Given his COVID positive status, all aerosol generating procedures had to be stopped. Overnight on 1/16/21 into 1/17/21, he had the onset of acute respiratory failure and was transported to the hospital. Per notes, he was put on BiPAP for several hours, but his CO2 level did not improve. Per prior advance directives completed with the resident and his two brothers, he had DNR/DNI orders. The hospital physician spoke with his brother and the decision was made to move to comfort care. He was discharged to inpatient hospice and died around 4pm on 1/18/21. This outcome does not appear to be vaccine-related, but death from COVID-19 infection is listed as a reportable event following COVID-19 vaccination.

No prior vaccinations for this event.

HOT FLUSH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Vaccine received at about 0900 on 01/04/2021 at her place of work, Medical Center, where she was employed as a housekeeper. About one hour after receiving the vaccine she experienced a hot flash, nausea, and feeling like she was going to pass out after she had bent down. Later at about 1500 hours she appeared tired and lethargic, then a short time later, at about 1600 hours, upon arrival to a friends home she complained of feeling hot and having difficulty breathing. She then collapsed, then when medics arrived, she was still breathing slowly then went into cardiac arrest and was unable to be revived.

No prior vaccinations for this event.

HUMAN CHORIONIC GONADOTROPIN NEGATIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was

No prior vaccinations for

not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

HUNT AND HESS SCALE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head	No prior vaccinations for this event.

notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

	HYPERAESTHESIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient obtained initial dose of Moderna vaccine on Thurday, Jan 14. No adverse effects reported during initial 15 minute post vaccine waiting period. Saturday morning (Jan 16), patient developed severe cough, labored breathing, and fever. Additionally patient mental status changed suddenly, became non-communicative (unable to speak, but would scream if she was touched). O2 status was irregular, dropping to 78. Sunday morning, EMT and then hospice was hospice called. Monday morning, after hospice emergency kit was initiated, patient passed away.		No prior vaccinations for this event.
	HYPERCAPNIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Lethargy/altered level of consciousness lead to hospital admission. Multiple interventions during hospitalization. Final hospital diagnoses: Acute respiratory failure with hypercapnia, acute pansinusitis.		No prior vaccinations for this event.

HYPERGLYCAEMIA		**COVID19 (COVID19 (MODERNA)) (1201)**
Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).		No prior vaccinations for this event.

Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't		No prior vaccinations for this event.

hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA- 1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

HYPERHIDROSIS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Resident received 1st dose on 1/4/2021. On 1/6/2021 resident having SOB, increased weakness with O2 sats at 91% RA. On 8th resident sustained a fall, O2 sats 88-92, dizzy, weakness. Rapid COVID test performed with negative results. Evening of 8th resident was lethargic and diaphoretic with fever of 99.9. Resident transferred to ER, on 5lt of oxygen. Resident returned from the ER on 1/9/2021 with new diagnosis of Leukemia and orders for hospice. Continued with fever, crackles and N/V and loss of appetite from the 9th and 10th of January. Resident expired at 820am on 1/11/2021.

HYPERHIDROSIS		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were	No prior vaccinations for this event.	

no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk

away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

HYPERHIDROSIS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Resident received the 2nd dose of the Covid vaccine approximately around 1105 by pharmacy through the pharmacy LTC partnership vaccination program. Resident had no adverse effects until around 8:00 pm she began complaining of body aches, and chills, Tylenol was given at this time. Around 9:30pm resident was sleeping in bed. Around 12:00 am the CNA called nurse into room to assess resident as the resident stated she did not feel good. Temperature at that time was 102.2, and vomiting. RN came to assess @ 1220 am She was noted to be vomiting, diaphoretic, pale and having trouble breathing. Temp was 97.3 after vomting, Pulse 53, Resp 20, o2 sats were 40-45%, unable to obtain Blood pressure, Applied 5 L of oxygen at this time and had LPN call 911 immediately. Resident was repsonsive and able to follow staff members instructions but was only answering yes or no simple questions at the time time of assessment. Paramedics arrived at 0040 and resident was sent to Hospital. @ 0130 ER nurse called to nursing facility to notify resident had coded in the ER and passed away @ 0110. ok. Blood sugar at 11pm was 230. Gave her 15u lantus at 11pm (normally 25u). Was sleeping at 2:30am but had died at next check at 3:30am.		for this event.
	HYPERSOMNIA	**COVID19 (COVID19 (MODERNA)) (1201)**
I video chatted with her Thursday after receiving the vaccine. My mom was in poor health but she was talking in complete sentences and responded appropriately. She was upright in bed and made eye contact. She smiled and denied pain. By Sunday, she was extremely weak and unable to sip water with a straw. Her health had changed dramatically and rapidly. She moaned in pain and was very fatigued. Her condition continued to deteriorate over the week and she stopped talking and was constantly sleeping. They started antibiotics for the oozing cancer lesion and then morphine for pain and end of life care. She passed away on January 22nd which was 15 days post vaccination.		No prior vaccinations for this event.
	HYPERSOMNIA	**COVID19 (COVID19 (MODERNA)) (1201)**
On February 11, 2021 around 10:15 am, patient was given the Moderna brand COVID-19 vaccination. After his vaccination, he was instructed to wait around for 15 minutes after the administration of the vaccine. During this time, there were no reported issues with the patient. On February 15, 2021 around 9:15am, patient's wife called the pharmacy and spoke with the pharmacist informing her that patient had passed away in his sleep on Saturday evening. Patient's wife inquired about whether death may have been caused by an adverse reaction to the vaccine. During the call patient's wife mentioned that patient slept a lot the day of the vaccine and the day after. patient's wife mentioned that patient woke up Saturday to eat breakfast and lunch. She states that later that evening, she found patient asleep and cold which she then realized that he'd passed away.		No prior vaccinations for this event.

(MODERNA)) (1201)

Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA-1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

No prior vaccinations for this event.

HYPERTENSION	COVID19 (COVID19 (MODERNA)) (1201)
Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.	No prior vaccinations for this event.

	HYPERTENSIVE CEREBROVASCULAR DISEASE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient with history advanced vascular dementia, hypertensive cerebrovascular disease and stroke, T2DM. Received her second dose of Pfizer COVID-19 vaccine at approximately 14:00 and was reported to have expired at home at 20:55. Dr. (Medical Director) spoke with patient's son/caregiver 2/4/21. Son reports that patient was in her usual health yesterday morning, deemed well enough by son to travel for vaccination. He reports she had no bothersome symptoms after either first or second vaccinations. Specifically denied rash, wheeze, and difficulty breathing. Son was with patient throughout the day. In the evening, when preparing for bed, he noted she became suddenly unresponsive in a similar fashion as she has done several times in past years. While in all previous such episodes she recovered within minutes, last evening she did not regain consciousness, experiences a brief period of labored breathing, and died. Patient's son called 911 and the patient's body was brought to the medical examiners. The medical examiner declined to proceed with autopsy. Patient's son is not interested in autopsy. Patient's son reports confidence that his mother's underlying hypertensive/diabetic cardiovascular disease is the natural cause of her death. Other Relevant Hx: Symptoms: & Death Treatment:		No prior vaccinations for this event.
	HYPERTENSIVE URGENCY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
presented to ED 1/9/21 with abdominal pain, progressive worsening weakness and fatigue and new onset A fib with RVR likely due to hypertensive urgency . Patient progressed clinically with severe hypoxia and transferred to ICU and started on BiPAP; progressive decline with decreased urinary output with uremia likely secondary to sepsis. Concern with patient worsening clinical decline, palliative care had been consulted on end of life care. Patient expired 1/17/21		No prior vaccinations for this event.

HYPERVENTILATION

COVID19 (COVID19 (MODERNA)) (1201)

Death Narrative: Patient received Covid vaccine on 2/2/21, person reports his legs were more rigid with some sweating the day of the vaccination with leg rigidity that was slowly improving. No other adverse effects reported for following 7 days. Person states he had vomiting episode earlier this week, person states he had no other symptoms before or after the vomiting episodes. On morning of 2/12/21, person reports patient got up ready for breakfast with no issues. She says he asked for chorizo and oatmeal but she laughed and said don't you mean chorizo and eggs. He said yes. They got him into W/C and he was rolling himself into dining room got stuck in hallway. She says he took several breaths then 3 very deep breaths and passed away. She called 911 they took his VS but he has passed. She told them to leave him along no resuscitation.

No prior vaccinations for this event.

HYPOAESTHESIA

COVID19 (COVID19 (MODERNA)) (1201)

My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country

No prior vaccinations for this event.

failed him.

	HYPOAESTHESIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
After the second vaccine dose she reported not feeling well with unspecified symptoms for a few days. On February 18th, 2021 she visited her doctor with numbness in her hand. They thought it may be carpal tunnel and sent her home. The morning or March 18th , 2021 she had a severe stroke and was transferred to Hospital and then to other hospital. She was in the hospital until Tuesday March 23rd when she was transferred back to her home for hospice care. She died on March 26th, 2021.		No prior vaccinations for this event.
	HYPOCHROMASIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.		No prior vaccinations for this event.
	HYPOGLYCAEMIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever,		No prior vaccinations for this event.

and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

HYPOGLYCAEMIA

COVID19 (COVID19 (MODERNA)) (1201)

Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.

No prior vaccinations for this event.

HYPOGLYCAEMIA

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Admitted 1/14/21: Patient is an elderly 93-year-old female with multiple medical problems including chronic combined CHF, P 80, diabetes mellitus, HTN, hyperlipidemia, CKD stage 3, has been complaining of generalized weakness, fatigue, decreased appetite for the past few days. She had an outpatient COVID-19 vaccine earlier today. Within 2 hr of admitting the patient to the hospital, condition clinically deteriorated. Patient elected to be DNR/DNI while in the ED. Patient was pronounced dead at 10:30 p.m. earlier today. Preliminary cause of death: Hypoglycemia induced lactic acidosis.	No prior vaccinations for this event.

HYPOPERFUSION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up.

No prior vaccinations for this event.

CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

HYPOPHAGIA

COVID19 (COVID19 (MODERNA)) (1201)

Patient had mild hypotension, decreased oral intake, somnolence starting 3 days after vaccination and death 5 days after administration. He did have advanced dementia and was hospice eligible based on history of aspiration pneumonia.	No prior vaccinations for this event.
HYPOPHAGIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Accelerated decline in condition with decreased input, decreased responsiveness, somnolence, and death	No prior vaccinations for this event.
HYPOPHAGIA	**COVID19 (COVID19 (MODERNA)) (1201)**
This patient has been under hospice care for over 2 years at the nursing home. She has had a steady decline with gradual weight loss. She was totally dependent in her care needs. She received the vaccine on 1/2/2021 as part of the facility vaccination campaign. No adverse events noted initially. On 1/3/2021 at 6:06 pm, she was noted on vital sign checks (done every 4 hours for first 72 hours after vaccination) with BP 64/52 but otherwise asymptomatic. Subsequent BP improved. On 1/4/2021 at 4:45 am, pt found with respiratory rate of 30 with otherwise normal vital signs. Tachypnea persisted, so she received liquid morphine 2.5 mg without improvement. Supplemental oxygen was applied. Tachypnea persisted. She had poor oral intake after that point had persistent tachypnea and worsening hypoxemia despite clear lungs on exam. She remained under hospice care and comfort measures were continued. No blood testing or imaging tests were done. She required increasing amounts of oxygen, became hypotensive, and died peacefully on 1/8/2021 at 7:45 pm.	No prior vaccinations for this event.
HYPOPHAGIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Narrative: Patient experienced cardiac arrest with PEA and a witnessed collapse upon arrival to the emergency department on 1/24/21. Patient received his first dose of the COVID vaccine on 01/15/2021and felt	No prior vaccinations

poorly thereafter. He was describing shortness of breath to his wife and requiring 5L of O2 at home to maintain saturations in 80s, while he usually was on 3L to maintain saturations in the mid 90s. He had been oriented but more fatigued than normal and described bilateral shoulder pain (which was not new for him) as well as indigestion. Took Tylenol with some relief. He had decreased PO intake and less appetite. The patient's wife encouraged him to come to the hospital daily for a week prior to admission, but the patient did not want to because he felt his side effects were secondary to the vaccine. Symptoms:RespDepression, Palpitations, Syncope & cardiac arrest Treatment: EPINEPHRINE 1 MG ONCE 3 rounds given ,CALCIUM CHLORIDE 1000 MG ONCE		for this event.
	HYPOPHAGIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Mentation has declined since hospital discharger for fall on 2/6/20201. Patient has also had significant poor oral intake. Brought in due to apneic episodes. Abdominal pain - diffuse tenderness (right sided) Elevated liver enzymes - likely secondary to dehydration Increased serum creatine kinase - likely due to dehydration		No prior vaccinations for this event.
	HYPOPHAGIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient was transferred from hospital for further evaluation and care by pulmonologist. He started having symptoms a week before with fatigue, emesis, decreased p.o. intake, shortness of breath, vomiting and diarrhea. The two previous takes before death required increasing oxygen and family wanted everything done including intubation. He was transferred to ICU.		No prior vaccinations for this event.
	HYPOPHAGIA	**COVID19 (COVID19 (MODERNA)) (1201)**
EXTREME PAIN, STOPPED EATING/DRINKING -- STARTED MORPHINE		No prior vaccinations for this event.

HYPOPHAGIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**	
Client recevied the COVID-19 vaccine on 1/5/21 by the Vaccine clinic. Client tested positive for COVID-19 by rapid testing on 1/21/21, with c/o hurting all over and loose stools. She became non-verbal on 1/23/21 with poor intake. On 1/24/21 at 0537 Client was unresponsive and without vital signs. Orders were for DNR, and CPR was not initiated.		No prior vaccinations for this event.
HYPOPHAGIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient recevied the COVID-19 vaccine on 1/5/21 by the Vaccine clinic #1. Patient tested positive for COVID-19 by rapid testing on 1/6/21. She demonstrated poor appetite and fluid/food intake and an IV of Normal Saline was initiated on 1/7/21. Oxygen saturation was initiated on 1/12/21 at 4L per nasal cannula. for shortness of breath. On 1/22/21 at 0310 Patient was unresponsive and without vital signs. Orders were for DNR and CPR was not initiated.		No prior vaccinations for this event.
HYPOPHAGIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient began to demonstrate a cough the evening of 1/5/2021, after receiving the COVID-19 vaccine earlier in the afternoon. A rapid COVID-19 test was performed and was positive. She began to demonstrate shortness of breath with exertion on 1/7/21, and lethargy on 1/12/21. Appetite and oral intake began to decline on 1/12/21, and Oxygen saturation dropped on 1/16/21 to 82%, and oxygen was initiated at 3L per nasal cannula. On 1/19/21 at 0414 patient was unresponsive and without vital signs. Orders were for DNR, and CPR was not initiated.		No prior vaccinations for this event.

HYPOPNOEA		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient had no symptoms or adverse events until the next evening after shot (1/29/21) where daughter reported her having heart palpitations. Family told her to rest and did not seek medical attention. Saturday afternoon (1/30/2021), patient started experiencing labored breathing. Daughter called 911 and before the ambulance arrived, the patient's breathing became more and more shallow. Patient was taken to the local hospital and passed away Saturday evening around 5:30 pm.		No prior vaccinations for this event.
HYPOPNOEA		**COVID19 (COVID19 (MODERNA)) (1201)**
ON 02/08/2021 AROUND 0600 RESIDENTCOMPLAINED OF MOUTH PAIN AND RECEIVED OXYCODONE. DURING THE COURSE OF THE MORNING, RESIDENT EXHIBITED A FEW EPISODES OF LABORED/SHALLOW BREATHING AND SOB AT RESTING. 0XYGEN SATURATION RATE WAS 93-98% ON ROOM AIR, LUNG SOUNDS CLEAR IN ALL LOBES AND PULSE AND TEMPERATURE WITHIN NORMAL RANGE. AS THE DAY PROGRESSED, VITAL SIGNS REMAINED STABLE BUT RESIDENT CONTINUED TO HAVE PERIODS OF SOB/LABORED BREATHING.FAMILY AND NURSE PRACTIONER UPDATED AND THE ORDER WAS RECEIVED TO SEND PATIENT TO MEDICAL CENTER ER FOR EVALUATION PER AMBULANCE. RESIDENT TRANSPORTED AT 1425. RESIDENT RETURNED FROM THE ER AT 1830 ON HOSPICE CARE WITH THE DIAGNOSIS OF: ACURE RESPIRATORY FAILURE WITH HYPOXIA AND END OF LIFE DECISION MAKING. RESIDENT WAS MADE COMFORTABLE AND MONITORED DURING THE NIGHT AND EXPIRED AT 0630 ON 02/09/2021.		No prior vaccinations for this event.
HYPOPNOEA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
loss of consciousness Narrative: Patient received COVID-19 vaccine dose #1 on 1/6/21 w/o complications.		No prior vaccinations for

Per 1/6/21- 1/9/21 nursing notes, patient did not experience any injection site reactions, denied pain or tenderness at injection site, no dizziness, no n/v, remained afebrile. Around 1/9/21 @1810, patient became acutely nonresponsive after being helped to the edge of bed. Per nurses, he was previously awake/alert, talking and asymptomatic. Patient is DNR/DNI but facility rapid response emergency team called d/t patient's sudden change of condition. Emergency team helped patient into lying position. Per 1/9/21 ICU emergency team note, patient appeared comfortable w/ no palpable radial pulse and had minimal shallow agonal breathing. Pulse ox 94%, HR in 60s per machine. BP unmeasurably low by BP cuffx3. Resident passed at 18:20 pm.	this event.
HYPOPNOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident received vaccination on January 15, 2021. She was found unresponsive with shallow respirations on the morning of January 16, 2021 and was sent to ER via ambulance. The resident was admitted to medical center ICU where she passed away later that day.	No prior vaccinations for this event.

eventually coded once more and succumbed	this event.
HYPORESPONSIVE TO STIMULI	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
No reactions immediately after vaccine was given. Resident has dementia, has had multiple hospitalizations related to a renal stone recently. Had a tooth that was bothering her, went to see her dentist and it was extracted on 1/6/21. On 1/10 they noted feet and ankles are dark purple with white splotches appears to be mottling. Minimally responsive to voice and touch. Not eating. Compassionate visit with family. Family did not want hospice, did not feel it was needed, said, what more could they do for her than you're already doing? On 1/11 at 1950 was determined to be deceased.	No prior vaccinations for this event.
HYPORESPONSIVE TO STIMULI	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21	No prior vaccinations for this event.

HYPOTENSION

COVID19 (COVID19 (MODERNA)) (1201)

Patient had mild hypotension, decreased oral intake, somnolence starting 3 days after vaccination and death 5 days after administration. He did have advanced dementia and was hospice eligible based on history of aspiration pneumonia.

HYPOTENSION

COVID19 (COVID19

	(MODERNA)) (1201)
Patient presented to the Emergency Department complaining of chest pain, pale, cool diaphoretic, and hypotensive. The patient was discovered to have a large saddle pulmonary embolism, went into cardiac arrest and expired. Of note, the patient received her second Moderna COVID vaccine on 1/23, which would place her first one approximately 12/25 if she received them at the appropriate interval. This information is from the patient's daughter and the ED record, the information is not available in CAIR. Per the daughter, the patient started feeling ill on 1/21, improved on 1/25, and then acutely worsened on 1/27, resulting in the ED visit.	No prior vaccinations for this event.
HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
36 hours after vaccination, the patient had increased respiratory distress. He was placed on high flow nasal cannula oxygen with mild improvement. He then continued to be hypotensive requiring IV fluids and subsequently IV vasopressors. Patient's BP was stabilized with vasopresor, however he continued to deteriorate clinically with altered mental status and lethargy, concerned for bowel peroration based on physical exam by MD. He was then emergency intubated and placed on mechanical ventilation. He was then transferred to acute care hospital near by.	No prior vaccinations for this event.
HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
6 days after vaccine developed bloody diarrhea. Thought to have ischemic colitis but negative evaluation. became hypotensive bradycardic placed on ventilator. Subsequently was poorly responsive and eventually coded once more and succumbed	No prior vaccinations for this event.
HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**

Patient awake at 0300. When going into the room to get him ready for dialysis he was cold to touch, unresponsive other than to sound, and nonverbal. O2 sat was 67 via finger probe. Oxygen immediately initiated and a venturi mask retrieved and initiated. When unable to arouse him via sternal rub this RN called 911. Send to ED. Febrile 39.2 and hypotensive 58/43. Admitted. unknown after that as patient expired in hospital.		No prior vaccinations for this event.
	HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
Moderna Vaccine Lot 029K20A Patient received second dose of vaccine on 2/2/21. Within 30 minutes patient had a near syncopal episode. She felt lightheaded and shortly after had episode of nonbloody vomiting. Hypotensive 81/69 and started on levophed. Alert and orientated. Lungs clear, abdomen benign on admission. Patient had no reaction when received first dose of the vaccine. Patient developed worsening shortness of breath, tachypnea, Afib with RVR, hypotension and required intubation and multiple pressors.		No prior vaccinations for this event.
	HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for		No prior vaccinations for this event.

vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.

	HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt presents to ER with increased weakness, hypoxia, history of COPD, but not oxygen dependent., hypotension. Acute Kidney failure noted in labs, not previously diagnosed , new hyperkalemia. 	HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
1/31/2021 12:50 Nursing Note Note Text: Res had low BP, low O2 sats, 30 breaths per minute, eyes open wide, making confused utterances. Started supplemental oxygen via NC, 2L, then 3L. Sats went up to 93% for a while, Sprvsr called. Unable to auscultate Left lung sounds. Called to update Res daughter. Called to page NP, writer went back to assess Res and O2 sats were 88%, turned O2 to 4LPM, called 911 for transport to Hospital ED. Left around 1030. NP called back afterwards, was updated. Family updated that Res was sent to Hospital ED. Note Text: Received phone call from daughter as well as information from hospital. Resident has pneumonia with septic shock. She is on abx and had thoracentesis performed for large pleural effusion. [linked]		No prior vaccinations for this event.

	HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident tested NEGATIVE for COVID-19 last 1/25/2021. She was on monitoring for desaturation and low blood pressure on Jan. 27,2021		No prior vaccinations for this event.

HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.	No prior vaccinations for this event.
HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
ER visit 1/25/21 patient walked into a prompt care and collapsed, witnessed and pulseless CPR with ROSC after 6-7mins, no shock no meds. Awake and speaking upon arrival to ER. 2 plus pitting edema ble ER diagnosis Anasarca, cardiac arrest, hypotension, elevated troponin I levels, Acute kidney injury and syncope. ER notes reveal a syncopal episode in the shower prior to collapse at prompt care. Central line placed and plan to ship to another facility, patient continued to decline despite dopamine and dobutamine expired in ER prior to transfer.	No prior vaccinations for this event.
HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
Per ED note: Brought in ED by EMS at 1945 for acute shortness of breath and hypotension. Patient was placed on supplemental oxygen and covid test completed. Patient was placed on BiPAP to maintain oxygen greater than 90%. Found to be in metabolic acidosis. Patient became unresponsive and pulse could not be palpated. Chest compressions were initiated. ACLS medications given and pulses regained. Patient lost pulse 30 mins later and never regained pulse. Per ED noted; likely developed a PE. Passed away at 2127	No prior vaccinations for this event.
HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**

Patient experienced an episode of emesis and loss of consciousness several hours after vaccine on 2/16/21. He was taken by EMS to the hospital and was noted to be hypoxic and hypotensive. He was admitted to the hospital and subsequently intubated. He was also found to have a small bowel obstruction and a nasogastric tube was placed to decompress the bowel. He required pressor support as well. He expired on 2/17/21.	No prior vaccinations for this event.	
HYPOTENSION		**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine was administered at Nursing Facility. Patient is an 89-year-old female with prior medical history of CVA with dysphagia, history of possible dementia, GERD, hyperlipidemia, and a pacemaker. She is a resident from town. She was sent for hypotension with a blood pressure of 90/52, tachypnea respirations of 54, possible aspiration pneumonia. Status post Covid vaccine earlier today. History is limited as patient is nonverbal on my exam. Death within 24 hours of vaccination	No prior vaccinations for this event.	
HYPOTENSION		**COVID19 (COVID19 (MODERNA)) (1201)**
Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).	No prior vaccinations for this event.	
HYPOTENSION		**COVID19 (COVID19 (MODERNA)) (1201)**

"""Feeling Hot"" without fever and nausea 10 hours post vaccine and resolved within 1 hour. Seizure, Hypotension, Unresponsive followed shortly by cardiac arrest and pulseless electrical activity 21 hours post vaccine. Pronounced dead 22 hours post vaccine"	No prior vaccinations for this event.
HYPOTENSION	**COVID19 (COVID19 (MODERNA)) (1201)**
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated	No prior vaccinations for this event.

as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

HYPOTENSION

COVID19 (COVID19 (MODERNA)) (1201)

Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced

No prior vaccinations for this event.

dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA-1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

Early in the shift on January 31 resident was noticed to be more tired than usual and was not eating well. Lung sounds were crackly and resident was found to be hypotensive. He was evaluated in emergency department. He was diagnosed with pneumonia. Received a loading dose of antibiotic and returned to facility.		No prior vaccinations for this event.
	HYPOTENSION	**COVID19 (COVID19 (PFIZER-BIONTECH))**

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient		No prior vaccinations for this event.

developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.

	HYPOXIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received the Moderna COVID vaccine 1/28/21. He was tested for COVID 19 on 1/29/31. Results were received 1/30/21, at which time he was evaluated and found to be hypoxic with tachycardia. He was sent to the local ER and returned this same day. On 2/2/21, he was evaluated by the provider, who sent him to the emergency room with acute respiratory distress and poor O2 sats		No prior vaccinations for this event.

	HYPOXIA	**COVID19 (COVID19 (MODERNA)) (1201)**
"Resident complained of feeling ""hot"" at supper time. Had emesis an hour or so later. Became hypoxic and was transferred to the hospital emergency room. Her evaluation in the ED revealed continued presence of UTI, leukocytosis (19.8), and renal insufficiency (BUN 22 Cr. 1.3) BP 99/63; P 74; Temp 98.1; RR 16; and O2 sat of 95% with 2 LPNC (she is typically on RA). CXR reported changes most consistent with CHF with cardiomegaly and bilateral pulmonary vascular prominence. Bibasilar pleural effusions greater on the right than left with pulmonary edema. Large hiatal hernia and likely old chronic wedge defromities involving the mid thoracic vertebral body. She was admitted for IV antibiotics. She expired 2/6/2021"		No prior vaccinations for this event.

	HYPOXIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt presents to ER with increased weakness, hypoxia, history of COPD, but not oxygen dependent., hypotension. Acute Kidney failure noted in labs, not previously diagnosed , new hyperkalemia. BP 73/39, HR 67. dopamine initiated, and switched to Levophed. Oxygen Sat 86%, requiring 10 L O2. Transferred from this		No prior vaccinations for this event.

critical access hospital to another Hospital. Expires later 2-13-2021

	HYPOXIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.		No prior vaccinations for this event.

	HYPOXIA	**COVID19 (COVID19 (MODERNA)) (1201)**

Patient experienced an episode of emesis and loss of consciousness several hours after vaccine on 2/16/21. He was taken by EMS to the hospital and was noted to be hypoxic and hypotensive. He was admitted to the hospital and subsequently intubated. He was also found to have a small bowel obstruction and a nasogastric tube was placed to decompress the bowel. He required pressor support as well. He expired on 2/17/21.

No prior vaccinations for this event.

HYPOXIA

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with

No prior vaccinations for this event.

hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

	HYPOXIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Hypoxia, Decreased responsiveness, Narrative: 86yo male with PMHx HTN, Afib not on AC after head trauma, CVA, and colon cancer who was brought to the ED by his family on 2/17. Per documentation the pt was in his usual state of health until 2/16. Received Moderna covid vaccine #2 on 2/16/21 at 0900, and was monitored for 15 minutes following immunization no noted issues. Later that night, had myalgias and took Tylenol. Per the family he slipped on the ice and fell on his butt. Overnight, had several dark stools and vomitus. was brought to the ED by his family because he was being less responsive. Pt arrived to the emergency department in extremis. No pulse identified. CPR immediately initiated for several rounds lasting about 25-30 minutes. ROSC unable to be achieved. Patient expired on 2/17 at 1941. Of note, per previous documentation had waxing and waning mental status at baseline. No symptoms noted with 1st dose of Moderna vaccine, which was administered on 1/16/21.		No prior vaccinations for this event.

	HYPOXIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident became SOB, congested and hypoxic requiring oxygen, respiratory treatments and suctioning. Stabilized after treatment and for the next 72 hours with oxygen saturations in the 90s. 	"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new	No prior vaccinations for this event.

periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on

admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

ILLNESS		**COVID19 (COVID19 (MODERNA)) (1201)**
This is the patient who passed away 2d after his second COVID vaccine. Of note, the 2/8 telephone note makes it sound like he was hospitalized at time of death - that is incorrect. His daugther listed as EM contact works in the eye clinic here. He had mild illness, completed 10d isolation but missed his scheduled booster dose on 2/2 due to isolation. He was called on 2/5 when there was a booster visit cancellation and received his booster dose on that day. His daugther reported that he was doing fine and looking well on 2/7 AM, ate breakfast, shortly after stood up and just collapsed.	No prior vaccinations for this event.	
ILLNESS		**COVID19 (COVID19 (MODERNA)) (1201)**
Was given without consent from POA patient got severely sick and never recovered later passed away only live 1 month POA did not allow second vaccine to be given just wanted to report this vaccine was given illegal without POA knowledge	Hives	

ILLNESS	COVID19 (COVID19 (MODERNA)) (1201)
Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA-1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further	No prior vaccinations for this event.

information has been requested.; Reported Cause(s) of Death: Unknown cause of death

IMAGING PROCEDURE	**COVID19 (COVID19 (MODERNA)) (1201)**
Lethargy/altered level of consciousness lead to hospital admission. Multiple interventions during hospitalization. Final hospital diagnoses: Acute respiratory failure with hypercapnia, acute pansinusitis.	No prior vaccinations for this event.
IMAGING PROCEDURE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient family had been noticing onset confusion for a few weeks prior to vaccine and event. Patient was taken to ED when found unconscious and died of a subdural hemorrhage a few days after vaccine clinic at retirement home.	No prior vaccinations for this event.
IMAGING PROCEDURE ARTIFACT	**COVID19 (COVID19 (MODERNA)) (1201)**
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021	No prior vaccinations for this event.
IMMATURE GRANULOCYTE COUNT INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH))**

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or

No prior vaccinations for this event.

definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

IMMATURE GRANULOCYTE PERCENTAGE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.	No prior vaccinations for this event.

viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.

IMMUNOGLOBULIN THERAPY	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
92 year-old male with PMHx of vascular dementia, BPH, MDD, sleep disturbance , basal cell carcinoma of neck, osteoarthritis, BLE edema, Guillain-Barre syndrome 30 years prior, s/p COVID positive on 1/11/21 and received IV Bamlanivimab. Sent to hospital on 2/2/21 for altered mental status, generalized weakness with inability to lift bilateral UE and difficulty moving his BLE. He was treated for UTI with 7 days of Cefepime for Morganella Morganii. He was followed by neurology with MRI of the brain and CT of the spine without acute findings. Lumbar puncture unable to be obtained. He received 5 day course of IVIG for presumed Guillain-Barre . EMG showed generalized sensory motor polyneuropathy both axon loss and demyelinating type severe in degree. However, he did not recover from his GBS symptoms, was transferred back to the nursing home and died on 2/15/2021.	Influenza Vaccine

IMPAIRED WORK ABILITY	COVID19 (COVID19 (MODERNA)) (1201)
"Client came to nursing station about 2pm to report she ""was not feeling well"". Nurses took vital signs, then referred her to the vaccination clinic that was onsite. She was observed by vaccination team for a period of time. She reported shoulder pain radiating into shoulder blade in arm vaccine was received. Vaccination team offered ice pack to her, observed for a period of time, and released back to work. About 10pm that evening, she sent a text to another coworker that her pain was ""off the charts"" and that she had pain covering her whole left side of her body. She did not come to work in the morning and did not contact work. Well being check was performed at approximately 9am on 2/2/2021 and she was found dead in her home. 911 was immediately called and authorities took over the scene." 	INCARCERATED HERNIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Vaccinated 2/20. At that time, had symptoms of incarcerated hernia, went to ED for evaluation. Not felt to warrant hospital admission. Returned two days later with agitation, altered mental status, and incarceration. Went to OR, uncomplicated hernia repair. Postoperatively, did not recover mental status. Went into arrythmias POD 4, hypotension ensued, had multiple interventions and evaluations without satisfying answers for clinical course.		No prior vaccinations for this event.
	INCOHERENT	**COVID19 (COVID19 (MODERNA)) (1201)**
She had pain in the injection site Tuesday night and then during Tuesday she got worse with nausea and some fever. By Wednesday she was complaining that she could not pee even though she was drinking a lot of fluids. She continued to complain it was the worst she ever felt and then at 0600 Thursday morning she woke us up and said she needed to go to the hospital. We arrived at the hospital just before 0700 and she immediately threw up in the trash can. We went into a treatment room and they took blood and started fluids as she became incoherent. She said she had taken Tylenol so they started a drug to counter that but her liver function was all wrong and they started to look for a hospital that could transplant a liver. She was air evade about 0930 to Medical center and just over 30 hours latter she was dead. There is a pending autopsy. She was a healthy 39 year old mother who got the shots because she worked as a surgical tech and she was the single mother of a 9 year old little girl.		No prior vaccinations for this event.

71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death	this event.
INFLAMMATORY MARKER INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from	No prior vaccinations for this event.

facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note:

""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

INFLUENZA LIKE ILLNESS

COVID19 (COVID19 (MODERNA)) (1201)

Patient reported mild flu like symptoms from vaccination later that evening. Next morning LTCF staff found pt deceased

No prior vaccinations for this event.

INFLUENZA LIKE ILLNESS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

PATIENT GOT HER FIRST COVID PFIZER VACCINE AT 12/31 IN THE AM. HAD GOTTEN FLU LIKE SYMPTOMS AND HAD BEEN SICK FOR A COUPLE OF DAYS. HAD NAUSEA AND VOMITTING DURING THIS TIME AS WELL. ON 1/3 THE CARE GIVER WENT TO CHECK ON HER PT AT HER LTC FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.

No prior vaccinations for this event.

INFLUENZA LIKE ILLNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Per Patients Wife - Same day - Flu like symptoms, Nausea, Headache. Restless that night. Next day - Weak, shortness of breath. Wife called squad to get him out of his wheelchair but patient refused hospital as it gets him agitated. Patient passed away around 11 AM the day after vaccination.	No prior vaccinations for this event.
INFLUENZA VIRUS TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Approximately 10 minutes after receiving the COVID- 19 vaccine resident displayed seizure activity, staring straight ahead and strong allover muscle jerking of both the up and lower extremities, color became gray, activity lasted approximately 3 minutes, resident then became relaxed, color returned to normal, BP-140/80, 97.8, 60, 16, sleeping the remainder of the shift,. Resident continued to decline until resident CTB on 1/19/21	No prior vaccinations for this event.
INFLUENZA VIRUS TEST NEGATIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
12/30/2020 07:02 AM Resident noted to have some redness in face and respiration were fast. Resident vital signs were abnormal except blood pressure. Temp at the time was 102.0 F taken temporal. Resident respirations were 22 labored at times. Pulse is 105 and pulse ox 94% on room air. Resident is made comfortable in bed. Notified triage of change in condition also made triage aware of resident receiving Covid vaccination yesterday morning. Resident appetite and fluid consumption has been poor for few days. 12/30/2020 07:32 AM Received order from agency to administer Acetaminophen 650mg suppos rectally due to resident not wanting to swallow anything including fluids, medications and food. This writer administered medication as NP ordered. Will monitor for effectiveness and adverse effects if any. 12/30/2020 08:41 AM Received new orders to obtain Flu swab, obtain CBC and BMP, and Chest Xray all to be obtained today.	No prior vaccinations for this event.

Notified family of resident having temperature and vital signs excluding b/p that was abnormal. Family was thankful for call and inierated to nurse that family does not want resident sent to hospital. Did educate family on benefits of Hospice services, but family persistant on continued daily care provided by nursing staff. Requests visits if decline continues. Family assured if resident continues to decline, facility will accomandate resident family to be able to be at bedside when time comes to do so. NP ordered IVF and IV Levaquin on 12/31/20. Family chose at that time to sign for Hospice services and not have resident provided with IVF or IV Antibiotics

	INFLUENZA VIRUS TEST NEGATIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
CARDIAC ARREST THAT LEAD TO DEATH - IT WAS REPORTED BY EMS THAT THE PT HAD RECEIVED THE VACCINE ABOUT 30 MINS PRIOR. HE ARRIVED HOME, BECAME SHORT OF BREATH & COLLAPSED. 911 WAS CALLED AND HE WAS TRANSPORTED VIA EMS TO HOSPITAL (16:17) WHERE HE LATER EXPIRED (23:01).		No prior vaccinations for this event.
	INFLUENZA VIRUS TEST NEGATIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
Died; Increased respirations (22 and labored at times); Pulse 105; 94% O2 on RA; Labored breathing at times; leukocytosis; elevated BUN; left lower lung congestion; elevated creatinine; Temperature of 102.0F; Redness on face; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced redness on face, increased respirations, labored breathing at times, temperature of 102F, pulse of 105, 94 percent O2, leukocytosis, elevated BUN, left lower lung congestion, elevated creatinine, and death. The patient's medical history, as provided by the reporter, included dementia and reduced mobility. No relevant concomitant medications were reported. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient began to experience redness on her face,		No prior vaccinations for this event.

increased respirations (reported as 22 and labored at times), pulse of 105, and 94 percent oxygen saturation on room air. The patient had a fever of 102 degrees Fahrenheit. Laboratory tests revealed a negative influenza swab, elevated white blood cell count of 14.1, elevated BUN at 113, and creatinine 2.7. Chest x-ray showed mild, left lower lung infiltrate. On 31 Dec 2020, the patient went under hospice care per her family request.. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2021, the cause of death was unknown.; Reporter's Comments: This case concerns a 92-year-old, female subject with medical history of dementia and reduced mobility, who experienced the serious unexpected events of death, respiratory rate increased, heart rate increased, oxygen saturation decreased, elevated BUN, elevated creatinine, left lung congestion and dyspnoea and the non-serious events of erythema and pyrexia. The events of respiratory rate increased, heart rate increased, oxygen saturation decreased, dyspnoea, erythema and pyrexia occurred 2 days after the first dose of the study medication administration, and the event of death occurred 4 days after the first dose of the study medication administration. Very limited information regarding the events is available at this time and no definite diagnosis or autopsy report have been provided. Additional information has been requested.; Reported Cause(s) of Death: Died

COVID19 (COVID19 (MODERNA)) (1201)

Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient

No prior vaccinations for this event.

who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to

No prior vaccinations for this event.

initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

health on 2/2/21. He received the 2nd dose of COVID vaccine around 1000AM on 2/2/21. Reportedly started running fever of 100.1 and chills the afternoon of 2/2/21. Around 7:00PM he started having dry cough and was complaining of breathing difficulties. He subsequently vomited multiple times (was eating pizza and aspirated) then lost consciousness. His wife called 911, did CPR and EMS reported he in PEA at scene and was intubated. Transported to hospital. SARS CoV-2 and influenza negative.	this event.	
INFREQUENT BOWEL MOVEMENTS		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/22/2021 10:09 pm resident reported 1 episode of being nauseous and having dry heaves, no temperature, MD notified and nurse was told to continue to monitor, no new orders, daughter made aware. Vital signs being done every 4 hours. 2/23/2021 3:04am resident complains of nausea, scant BM amount x 2, MD notified and no new orders, continue to monitor and encourage fluids, vital signs continue every 4 hours.	No prior vaccinations for this event.	
INFUSION		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be	No prior vaccinations for this event.	

the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

INJECTION SITE DISCOMFORT **COVID19 (COVID19 (MODERNA)) (1201)**

2nd dose of Moderna at 9:00am. No side effect (except pinch at injection site) throughout the day and evening. At ~9:45pm, my wife suddenly fell unconscious. Immediate CPR & with Paramedic were not able to revive her. SHE PASSED AWAY at home. We believe it may be triggered by the vaccine. Did not have a chance to go to hospital or emergency room - it was too sudden. A sad day for us. No prior vaccinations for this event.

INJECTION SITE PAIN **COVID19 (COVID19 (MODERNA)) (1201)**

Headache, pain in the injection site, threw up. A few hours later she died. No prior vaccinations for this event.

INJECTION SITE PAIN **COVID19 (COVID19 (MODERNA)) (1201)**

Death Narrative: Patient received the first COVID-19 dose on 12/23. Afterwards, patient complained of localized pain on L deltoid area where the vaccine was administered; his temperature was 98.1 F. On 12/26-27, staff reported that patient appeared more fatigued than usual and was shivering on 12/27, which seized No prior vaccinations for this event.

after blanket was given. On 12/28, patient presented with fever (Tmax 100.2 F) and acetaminophen was administered for alleviation of fever. ADR was reported for the fever on 12/29. Patient continued to decline and was placed back on hospice care on 12/29; on 12/30. the symptoms reported on nursing note include erythema and pain on whole L arm. Lidocaine was applied. Patient's family and provider mutually agreed not to administer the second dose of vaccine. He continued to decline and was started on end-of-life care around 1/4 and passed on 1/20 1417.

	INJECTION SITE PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
"Client came to nursing station about 2pm to report she ""was not feeling well"". Nurses took vital signs, then referred her to the vaccination clinic that was onsite. She was observed by vaccination team for a period of time. She reported shoulder pain radiating into shoulder blade in arm vaccine was received. Vaccination team offered ice pack to her, observed for a period of time, and released back to work. About 10pm that evening, she sent a text to another coworker that her pain was ""off the charts"" and that she had pain covering her whole left side of her body. She did not come to work in the morning and did not contact work. Well being check was performed at approximately 9am on 2/2/2021 and she was found dead in her home. 911 was immediately called and authorities took over the scene." On 2/1/2021, the patients daughter, who claims is a nurse, reported this incident to me. She stated that the evening after the patient received the vaccine, she felt some mild injection site pain. The morning after, the patient reported severe abdominal pain, diarrhea and vomiting. The patients daughter then called her physician to report these symptoms and attributed them as an adverse reaction to the vaccine at that time. These symptoms were intermittent for one week and no other adverse reactions were noted. In the early morning hours of 1/27/2021, the patient was toileting and had expired while doing so. An ambulance was		No prior vaccinations for this event.

called and cause of death was not found. An autopsy was not performed.

	INJECTION SITE PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
She had pain in the injection site Tuesday night and then during Tuesday she got worse with nausea and some fever. By Wednesday she was complaining that she could not pee even though she was drinking a lot of fluids. She continued to complain it was the worst she ever felt and then at 0600 Thursday morning she woke us up and said she needed to go to the hospital. We arrived at the hospital just before 0700 and she immediately threw up in the trash can. We went into a treatment room and they took blood and started fluids as she became incoherent. She said she had taken Tylenol so they started a drug to counter that but her liver function was all wrong and they started to look for a hospital that could transplant a liver. She was air evade about 0930 to Medical center and just over 30 hours latter she was dead. There is a pending autopsy. She was a healthy 39 year old mother who got the shots because she worked as a surgical tech and she was the single mother of a 9 year old little girl.		No prior vaccinations for this event.

	INJECTION SITE PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
Toileting and had expired while doing so; Severe abdominal pain; Diarrhea; Vomiting; Mild injection site pain; A spontaneous report was received from a healthcare professional concerning an 88-year-old , female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events, toileting and had expired while doing so (death), mild injection site pain, severe abdominal pain, diarrhea, and vomiting. The patient's medical history was not provided. No relevant concomitant medications were reported. On 20 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 029L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 20 Jan 2021, the patient felt mild pain at the injection site after receiving the vaccine. On 21 Jan 2021, the patient reported severe abdominal pain, diarrhea and vomiting. These symptoms were intermittent for a week and no other adverse events were		No prior vaccinations for this event.

noted. On 27 Jan 2021, the patient passed away while toileting. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 27 Jan 2021. The cause of death was unknown. An autopsy was not performed.; Reporter's Comments: The gastrointestinal events were consistent with increased risk associate with elderly age of patient. The cause of death was unknown. Autopsy was not performed. Very limited information regarding the events is available at this time. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Reported Cause(s) of Death: unknown cause of death

INJECTION SITE PAIN		**COVID19 (COVID19 (MODERNA)) (1201)**
Passed away; Slight soreness in arm; A regulatory report was received from a pharmacist concerning a 72-year-old male patient who received Moderna covid-19 vaccine and death occurred 4 days after the vaccine and also experienced soreness in his arm after the vaccine administration. The patient's medical history includes diabetes mellitus, Hypertension, Hypercholesterolemia, CVD, previous stroke and Depression. No relevant concomitant medications were reported. No information on allergies. On 4-FEB-2021 at 10:43 am, prior to the onset of events, the patient received his first of two planned doses of covid-19 vaccine for the prophylaxis of covid-19 infection. He had soreness in his arm the day following the shot, but he had no other symptoms. He passed away on 08-FEB-2021 at 10 am. As per his wife, they never made it to the hospital, and he had poor health prior to vaccination. Action taken with 2nd dose of Moderna Covid-19 vaccine was not applicable. The outcome of the event death is fatal.; Reporter's Comments: This is a 72 year old male with hx of diabetes mellitus, hypertension, hypercholesterolemia, and CVD who died 4 days after the vaccine was administered. death Narrative: 86 year old MALE with PMH of Afib s/p AICD/PPM, HFrEF (EF< 20% 10/2019), DM2, HTN, HLD, BPH, Depression. Was stable and feeling well when he was administered Covid-19 vaccine on 02/17/2021- Pfizer COVID-19 Vaccine 0.3 ml IM. MVX (Manuf); PFR; Lot#; EL9267; Exp Date:05/31/2021 Administration Anatomic site: Right Deltoid; Pt was monitored for 30 minutes after administration and had no adverse effects. He was called later in the day and reports he feels well and has had no adverse reactions, he endorsed his arm is a little sore at injection site. ON 02/19/2021- his dghter found him on the floor, next to his bed, dead. She reported on 2/19/2021- that she was out with him to dinner on 2/18/2021, and he stated he did not feel well, that his insides did not feel right. He proceeded to have dinner and 2 drinks. HE was doing ok, when she took him home.		No prior vaccinations for this event.

	INJECTION SITE RASH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.		No prior vaccinations for this event.

INJURY		**COVID19 (COVID19 (MODERNA)) (1201)**
On 1/23/21 the patient had a single-car accident, slid off icy road into snowbank. She was seen in our ER, diagnosed w/ trauma and L4 compression fracture. She was transported to Hospital for further trauma workup. We believe she was treated and released. On 1/31/21 the patient had a headache but did not seek medical attention. In the morning of 2/1 she became unresponsive and was pronounced dead on the scene when EMS arrived. Autopsy showed a left temporal subdural hematoma.		No prior vaccinations for this event.
INSOMNIA		**COVID19 (COVID19 (MODERNA)) (1201)**
Pt received second Moderna COVID-19 vaccination administered in left arm at her assisted living facility by Pharmacist at 1153 on 2/19/2021. Pt was monitored for vaccine reaction with no known adverse reaction. Approximately 18 hours post-vaccine, she was found deceased in her sleep at 0540 on 2/20/21. Per circumstances/pt history, it is presumed that the patient aspirated while sleeping, perhaps secondary to a seizure. Coroner was notified and declined as coroner's case. VAERS notification being made due to pt death within 24 hours of receiving a vaccine.		No prior vaccinations for this event.
INSOMNIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1-12-21 Resident is complaining of heart pain. Resident blood pressure is 228/105. 1-22-21 Dx UTI 1-13-21 His nurse called MD at approximately 0645, reported to him that it was reported to this nurse that resident has not slept in 2 days and night, has an increased blood pressure, reports severe pain in lower back, and appears to be uncomfortable Resident is able to verbalize his pain and where it is at, but is unable to explain the quality of the pain or give a number on the 0/10 pain scale.		No prior vaccinations for this event.

INTENSIVE CARE

COVID19 (COVID19 (MODERNA)) (1201)

Patient received her first dose of the Moderna COVID-19 Vaccination on Saturday January 16th 2021 at approximately 12pm. She completed all necessary screening forms and was deemed to be at low risk for serious allergic reactions. She tolerated the vaccination well, and no complications or immediate adverse events occurred. She was observed for a full 15 mins per CDPHE/CDC guidelines and left the Clinic in stable condition after her observation period was complete. On the morning of Tuesday, January 19th, 2021, the patient was found unconscious and unresponsive by her husband. She was transferred by Ambulance to Hospital shortly thereafter. She was diagnosed with a brain bleed that was determined to be inoperable. She was transferred to other Hospital for higher level care. She was seen by neurosurgery and diagnosed with a ruptured aneurysm. She was treated in the ICU for 24 hours, at which point her team determined that the severity of her brain bleed would not respond to treatment. Supportive cares were withdrawn on Wednesday Jan 20th, and she passed away shortly thereafter.

No prior vaccinations for this event.

Patient was transferred from hospital for further evaluation and care by pulmonologist. He started having symptoms a week before with fatigue, emesis, decreased p.o. intake, shortness of breath, vomiting and diarrhea. The two previous takes before death required increasing oxygen and family wanted everything done including intubation. He was transferred to ICU.		No prior vaccinations for this event.

INTENSIVE CARE	COVID19 (COVID19 (MODERNA)) (1201)
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE,	No prior vaccinations for this event.

no acute PE.

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue		No prior vaccinations for

embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight this event.

1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

	INTENSIVE CARE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.		No prior vaccinations for this event.

	INTENSIVE CARE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
DEATH Narrative: Pt he reports he developed chills SOB body aches the same night as receiving the COVID vaccine on 1.26.2021-pt is currently reporting CheSt tightness and SOB Admitted to hosp: ICU with Bilateral Pulmonary Emboli, LLE DVT, NSTEMI, Arrhythmia.		No prior vaccinations for this event.
	INTENSIVE CARE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath		No prior vaccinations

61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the for this event. patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-

evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

INTERLEUKIN LEVEL

COVID19 (COVID19 (MODERNA)) (1201)

High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased; Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown)

No prior vaccinations for this event.

intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

INTERNAL HAEMORRHAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mother died suddenly on February 3rd. She went into shock/cardiac arrest and appeared to have internal bleeding. No autopsy has been performed. Unsure if it was related to the COVID vaccine.	No prior vaccinations for this event.
INTERNATIONAL NORMALISED RATIO	**COVID19 (COVID19 (MODERNA)) (1201)**
Passed away; UTI; Abnormal bleeding; A spontaneous report was received from a healthcare professional concerning a patient who received the Moderna COVID-19 Vaccine (mRNA-1273) and experienced abnormal bleeding, UTI, and passed away. The patient's medical history included a long term history of anticoagulation therapy. Concomitant product use included anticoagulation therapy. On 31Jan2021 prior to the onset of the events the patient recieved their first dose of mRNA-1273 (Lot number:not reported) intramuscularly for prophylaxis of COVID-19 infection. On 07Feb2021, the patient complained of abnormal bleeding. Patient was	No prior vaccinations for this event.

seen at clinic on 10Feb2021 and was diagnosed with a UTI and given antibiotics. An INR was also completed that day due to patient having a long term history of anticoagulation therapy. Results of that showed the INR to be 12. Prior to vaccination, patient's INR was normal and no changes to medications and diet were made after vaccination and prior to complaint starting. On 12Feb2021 the patient passed away. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12Feb2021. The cause of death was unknown. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns an 82 year old male patient, with history of long term anticoagulation therapy (unknown indication), who experienced a fatal event of death and abnormal hemorrhage, 13 days after receiving second dose of mRNA-1273 (Lot# Unknown). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

INTERNATIONAL NORMALISED RATIO INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Pt started complaining of chest heaviness and shortness of breath on the afternoon of 1/21/21. EMS was called to the patients home and she was found to have an O2 sat in the 70's. She was admitted to hospital and found to have a proBNP of 5000. She tested negative for Covid-19. She was determined to be in acute-on-chronic heart failure and was referred for hospice care. She passed away on the evening of 1/24/21.

No prior vaccinations for this event.

INTERNATIONAL NORMALISED RATIO INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.

No prior vaccinations for this event.

INTERNATIONAL NORMALISED RATIO INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient received the vaccine on 1/31/2021. Patient complained of bleeding 2/7/2021. Went to clinic where labs were conducted. Patient had an INR of 12. Previous INR results were normal prior to vaccination. Patient was also diagnosed with UTI and given antibiotics. Patient was encouraged to go to ER. Patient died on 2/12/2021.

No prior vaccinations for this event.

INTERNATIONAL NORMALISED RATIO INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.

No prior vaccinations for this event.

INTERNATIONAL NORMALISED RATIO INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated.

No prior vaccinations for this event.

ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration	No prior vaccinations for this event.

pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

INTESTINAL ISCHAEMIA

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
Received Pfizer Covid Vaccine in the AM on 2/9/21. Arrived to emergency department later the same day complaining of nausea, weakness, fatigue, Vomiting, Diarrhea. Post operative diagnosis, Ischemic colon/toxic megacolon.	No prior vaccinations for this event.
INTESTINAL OBSTRUCTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Grandmother had trouble breathing the night she got the vaccine. She went to the hospital. They found pneumonia and a partial bowel obstruction. The obstruction cleared but she died from the pneumonia on 2/16/21.	No prior vaccinations for this event.

bowel perforation; pain in her upper abdomen; This is a spontaneous report from a contactable consumer. An 86-year-old female patient received the 2nd dose of bnt162b2 (BNT162B2) at single dose on 13Jan2021 for Covid-19 immunisation, administerd at nursing home/senior living facility Medical history included dementia, arthritis. No known allergies. Patient was not pregnant. Patient had not COVID prior vaccination. Concomitant medication in 2 weeks included: memantine (manufacturer unknown) 10 mg BID, diclofenac (manufacturer unknown) BID, carbidopa, levodopa (manufacturer unknown) 25-100 mg TID, quetiapine (manufacturer unknown) 12.5 mg q HS, escitalopram oxalate (LEXAPRO) 10 mg q HS, paracetamol (TYLENOL) 650 mg BID, glucosamine (manufacturer unknown) drink. The patient received the 1st dose of bnt162b2 (BNT162B2) at single dose on 24Dec2020 for Covid-19 immunisation. No other vaccine received in 4 weeks. The patient experienced bowel perforation and pain in her upper abdomen on 18Jan2021 07:30. The events resulted in Emergency room/department or urgent care, Life threatening illness (immediate risk of death from the event),	No prior vaccinations for this event.

and death. On 18Jan2021 07:30 AM, less than a week after the second shot, she had pain in her upper abdomen and was taken to the ER on 18Jan2021. CT showed a bowel perforation in the small bowel. She had never had bowel surgery or diverticulitis. She had been healthy other than her dementia and arthritis. Patient received treatment for the events: hospice and pain management. COVID-19 was not tested post vaccination. The cause of death was bowel perforation. An autopsy was not performed. Information about lot/batch number has been requested.; Reported Cause(s) of Death: bowel perforation

INTRACRANIAL ANEURYSM	**COVID19 (COVID19 (MODERNA)) (1201)**
At approximately, 1855, I was alerted by caregiver, resident was not responding. Per caregiver, she was doing her rounds and found resident in bed, unresponsive, mouth open, observed gurgling noises and tongue hanging out of mouth. This primary caregiver observed resident at baseline and ambulating after dinner at approximately, 1800 less than an hour prior to incident. This PCG called 911 for EMS and gave report of incident. Resident was taken to Medical Center Emergency Department. At ER, CT scan and X-ray was performed. Per report from ER RN, CT scan and x-ray revealed an intracranial aneurysm and fluid in the lungs. Per RN, resident was still unresponsive and was admitted to Medical Center for observation and comfort measures. This primary caregiver reported to RN, resident recently received the first dose of COVID-19 vaccine on 1/2/21. Primary caregiver received a call from Castle RN at 0700, resident expired at 0615.	No prior vaccinations for this event.

asystole, to vfib, to asystole. ACLS followed. Unrecoverable asystole and patient time of death 0213.

INTRAOSSEOUS ACCESS PLACEMENT	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Few minutes post vaccination, after moving to observation area via wheelchair, the patient complained of dizziness. She took glucose tabs she had brought with her. Staff wheeled her to Triage # 1. Her eyes rolled back in her head and she lost consciousness. Staff (paramedics on site) transferred her to gurney and started compressions. AED placed, V- Fib was rhythm, Shock # 1 given, CPR resumed. Shocked again. Fire truck and additional EMT arrived on site and took over care. Epinephrine was given 3 times via intra-osseous route, Amiodarone given intra-osseous route. Additional defibrillation with on site AED for a total of 6-7 times. Patient had good chest rise with ambu-bag, no airway obstruction or peri-oral edema noted. Code called at 12:40 PM.	No prior vaccinations for this event.

INTRAVENTRICULAR HAEMORRHAGE	COVID19 (COVID19 (MODERNA)) (1201)
Patient presented with spontaneous IVH of small vessel origin with essentially no past medical history. She then acutely developed mesenteric ischemia. Died due to all dead small bowel which also appeared to be small vessel disease and not embolic/thrombotic. This process started one week after	No prior vaccinations for this event.

INTRAVENTRICULAR HAEMORRHAGE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out	No prior vaccinations for this event.

and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

INVESTIGATION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Stroke; This is a spontaneous report from a contactable consumer. A 94-year-old female patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 16Jan2021, at single dose, for COVID-19 immunisation. Medical history included ongoing hypertension (took medication). Patient did not have COVID-19 prior to vaccination. Concomitant included unspecified medication for hypertension. The patient experienced stroke on 31Jan2021. The patient was brought to the emergency room and hospitalized due to the event on 31Jan2021. No therapeutic measures were taken as a result of the event. The patient underwent lab tests and procedures	No prior vaccinations for this event.

which included COVID-19 virus test: negative in Feb2021 (a week before report); investigation: brain bleed and discovered she had a stroke (on unknown date in 2021). The patient died on 03Feb2021 due to stroke and old age. An autopsy was not performed. Patient's family did not attribute her death to the vaccine at all. The information on the Lot/Batch number has been requested.; Reported Cause(s) of Death: stroke; Old age		
	IRREGULAR BREATHING	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient noted to have irregular breathing in bed and unable to arouse. Provided life saving measures in the field x 30 minutes and transferred to hospital. Noted to have heart arrhythmia which suspected to cause cardiac arrest.		No prior vaccinations for this event.
	ISCHAEMIC CARDIOMYOPATHY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient did not have any adverse reaction to the COVID vaccine, but we were asked by our health dept to submit a VAERS report since the patient died between his first and second dose. Received Pfizer Dose #1 12/17/2020. No side effects or adverse events noted; lived in 24/7 care facility and monitored twice daily for reaction. Date of death 12/23/2020 from aspiration pneumonia complicated by end-stage heart failure and ischemic cardiomyopathy. Death was anticipated and not sudden.		No prior vaccinations for this event.
	ISCHAEMIC HEPATITIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of		No prior vaccinations

for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

for this event.

ISCHAEMIC STROKE

COVID19 (COVID19 (MODERNA)) (1201)

Massive ischemic stroke with aspiration, unable to arouse on the morning of 1/21/2021 and placed on Hospice with death 1/24/2021

No prior vaccinations for this event.

ISCHAEMIC STROKE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient admitted to hospital evening of 2/7/21 with acute ischemic stroke and received tenectaplase. Diagnosis Left MCA stroke. Reporting event given was just over 24 hours after first COVID vaccine dose.	No prior vaccinations for this event.

JAUNDICE	COVID19 (COVID19 (MODERNA)) (1201)
jaundice->hemolytic anemia-> hemorrhagic shock->multi organ failure->death pt admitted to ICU 2/16 with Hgb=3.4, treated with steroids, supportive care , pressors, pt died 2/20/21	No prior vaccinations for this event.

JOINT INJURY	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to	No prior vaccinations for this event.

comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."

	JOINT SWELLING	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.		No prior vaccinations for this event.
	KLEBSIELLA INFECTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)
1/24/21 0445- patient presents to the ED with complaints of neck pain, chest pain, and back pain for about a week. States also feels SOB, intermittent fever with temperature 100.3 on arrival. Patient was worked up for his cardiac type symptoms, found to have elevated WBC and CRP with no explanation. D-Dimer was elevated with CT showing no sign of PE. Patient was sent home from the ED with instructions to follow up with primary care and/or return if s/s worsen. 1/24/21 1705- patient is returned to the ED via ambulance after becoming unresponsive and some seizure like activity. Patient was intubated. Head CT showed large brain bleed that was irreparable and not compatible with life. Patient was also found with positive blood cultures x2 with gram positive cocci in clusters growing after 9 hours.	No prior vaccinations for this event.

LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)
cough congestive heart failure death	No prior vaccinations for this event.

LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)	
Patient presented to the Emergency Department complaining of chest pain, pale, cool diaphoretic, and hypotensive. The patient was discovered to have a large saddle pulmonary embolism, went into cardiac arrest and expired. Of note, the patient received her second Moderna COVID vaccine on 1/23, which would place her first one approximately 12/25 if she received them at the appropriate interval. This information is from the patient's daughter and the ED record, the information is not available in CAIR. Per the daughter, the patient started feeling ill on 1/21, improved on 1/25, and then acutely worsened on 1/27, resulting in the ED visit.		No prior vaccinations for this event.

LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)
Lethargy/altered level of consciousness lead to hospital admission. Multiple interventions during hospitalization. Final hospital diagnoses: Acute respiratory failure with hypercapnia, acute pansinusitis.	No prior vaccinations for this event.

LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)
Resident passed away unexpectedly on 01/19/21 after developing acute hypoxic respiratory failure on morning of 01/19/21. She was transferred to hospital via EMS where she was intubated, coded, and ultimately expired with uncertain underlying cause, potentially ACS.	No prior vaccinations for this event.

LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)
2/2/21-1000-patient presented to the local emergency room with complains of fever, shortness of breath and decreased oxygen sats. temp 101.7, pulse 102, respirations 36, BP 141/92, oxygen 94%. Lung sounds crackles bilaterally with rhonchi on the left. patient worked up for sepsis, CXR shows mild atelectasis. blood pressure dropped, and continued to drop through treatment requiring levophed drop to be initiated. Patient	No prior vaccinations for this event.

POA determined that this would not be her sister's wishes and made the decision to make patient comfort care status. 2/3/21- patient lethargic throughout night. 0640-patient demise.

LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)
"Patient had COVID vaccination on 2/3 with no adverse s/s before leaving unit. Upon coming to treatment Friday 2/5 he reported to the RN that he had fallen on thursday 2/4 due to ""getting up fast"" did not hit head or hurt anything per RN discussion. Began treatment without difficulty. About 3/4 way through treatment was talking with staff and became unresponsive - code was called and pt expired after 30 minute resuscitation efforts."	No prior vaccinations for this event.

LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)
Resident yelling for assistance in apartment. Nursing personnel found resident on floor at 6:10 AM on 2/18/2021. Resident was transported to Hospital on 2/18/2021. Status update on 2/18/2021 from son, resident CT & X-rays were done all normal. Labs done and WBC count was elevated and awaiting results. Resident stable and admitted to hospital for observation. Resident passed away on 2.21.2021.	No prior vaccinations for this event.

LABORATORY TEST	COVID19 (COVID19 (MODERNA)) (1201)
High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased; Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient	No prior vaccinations for this event.

received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

Patient woke up on the morning of 2/6 with symptoms of a stroke. Rushed to hospital where clot found in brain. Recovered from initial stroke but then had another major stroke on 2/8 and never recovered.	No prior vaccinations for this event.

LABORATORY TEST	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.

LABORATORY TEST ABNORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient had Covid-19 in October of 2020. He recovered. He received the vaccination on 12/30/2020 with no complaints. On 01-05-2021 it was noted to he was incontinent of urine and bilateral lower extremity edema. Lab work was completed showed acute kidney injury. He had decreased blood pressure and oxygen saturations on 01-06-2021 He was admitted to the hospital with rapid progression of symptoms and suggested multi-system failure. He had a long cardiac history. On 01-14-2021 he passed away with a diagnosis of Cardiomyopathic CHF, A.Fib contributory.		No prior vaccinations for this event.
LABORATORY TEST ABNORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
Admitted to hospital with sob upon exertion that started prior to vaccine. Hx COPD, HTN, CKD, hyperlipidemia, bladder cancer in remission. Stated he has been taking Eliquis and Xarelto between renal doctor and cardiologist Dr. Anticipating going home 2/5/21 but then turned blue and stopped breathing under a DNR. COVID test negative. Labs show acute on chronic renal failure with an elevated troponin likely from demand ischemia.		No prior vaccinations for this event.
LABORATORY TEST ABNORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
Resident had severe CAD, DM type 2, and hx of RBKA and left 5 digits on foot amputation. Hx of osteomyelitis post surgical. After last surgery, resident did not have a good appetite, more restless, increased confusion with dementia. Significant other passed away on 12/30/20, resident began refusing meals, decreased eating. Vaccinated on 1/13/21. On 1/25/21 Resident labs showed kidney failure. Dr. spoke with family and transitioned to Comfort care, on 2/5/21 went hospice. Patient passed away on 2/13/2021.		No prior vaccinations for this event.

LABORATORY TEST ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Three days after second COVID-19 vaccine, patient became lethargic. Due to advance directive that instructed that no life saving interventions to take place, patient continued to decline and expired on 29 January 2021.	No prior vaccinations for this event.
LABORATORY TEST NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient recieved vaccine 1 of covid 19 i 1/19/2021. She felt poorly on 1/20/2021. She felt dizzy and fell at 3 AM on 1/23/2021. She felt poorly and did not know her son's name which was not normal. She went to ER on 1/24. She was assessed as not having fractures. She was going to be transferred to a skilled nursing facility. She was not having respiratory complaints. She was awaiting transfer when her O2 levels started dropping substantially. She declined aggressive intervention and she died within a few hours.	No prior vaccinations for this event.
LABORATORY TEST NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
"This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show	No prior vaccinations for this event.

no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21."

LABORATORY TEST NORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Death Narrative: Patient received the first COVID-19 dose on 12/23. Afterwards, patient complained of localized pain on L deltoid area where the vaccine was administered; his temperature was 98.1 F. On 12/26-27, staff reported that patient appeared more fatigued than usual and was shivering on 12/27, which seized after blanket was given. On 12/28, patient presented with fever (Tmax 100.2 F) and acetaminophen was administered for alleviation of fever. ADR was reported for the fever on 12/29. Patient continued to decline and was placed back on hospice care on 12/29; on 12/30. the symptoms reported on nursing note include erythema and pain on whole L arm. Lidocaine was applied. Patient's family and provider mutually agreed not to administer the second dose of vaccine. He continued to decline and was started on end-of-life care around 1/4 and passed on 1/20 1417.

No prior vaccinations for this event.

LABORATORY TEST NORMAL

COVID19 (COVID19 (MODERNA)) (1201)

On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was

No prior vaccinations for this event.

scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.		
LABORATORY TEST NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient 101 years old, nursing home resident, received vaccine 1/11, on 1/13 found on floor without obvious trauma, unresponsive. Brought to ED and was bradycardic, hypotensive, hypothermic and refractory to aggressive medical management. No obvious cause of death found on exam or labs, cxr. Unknown if event could be related to vaccine or not. Medical Examiner accepted case although initially unknown that patient had recently received vaccine. ME updated with that information today as soon as discovered.		No prior vaccinations for this event.
LACTIC ACIDOSIS		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Admitted 1/14/21: Patient is an elderly 93-year-old female with multiple medical problems including chronic combined CHF, P 80, diabetes mellitus, HTN, hyperlipidemia, CKD stage 3, has been complaining of generalized weakness, fatigue, decreased appetite for the past few days. She had an outpatient COVID-19 vaccine earlier today. Within 2 hr of admitting the patient to the hospital, condition clinically deteriorated.		No prior vaccinations for this event.

Patient elected to be DNR/DNI while in the ED. Patient was pronounced dead at 10:30 p.m. earlier today. Preliminary cause of death: Hypoglycemia induced lactic acidosis.

LARGE INTESTINAL OBSTRUCTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was an 87 y/o female admitted for septic shock. She was started on and eventually maxed on 3 pressors. CT abd showed colonic obstruction with dilatation of large and small bowel. Patient was made DNR in the ED. Palliative care consulted on case. Family opted for comfort care. Patient was asystole on monitor. No spontaneous breath/cardiac sounds ausculted. Patient did not withdraw to pain. Pupils fixed and dilated. She was pronounced and 1230 on 1/28/21	No prior vaccinations for this event.
LARYNGEAL MASK AIRWAY INSERTION	**COVID19 (COVID19 (MODERNA)) (1201)**
Almost immediate headache per wife. Developed fever around 4 pm. Headache all day. Took Tylenol at 4 and 10 pm. Gradual development of SOB and cough. Temp of 101.4 at 10 pm. pulse ox 92% at 10 pm. Went to sleep, woke up at 0050 with increasing SOB. Pulse ox 82%. Used albuterol inhaler, wife called emergency services at 0113. EMS arrived around 0130 to patient's home. pulse ox 86%, coughing, sob, hard time breathing. Walked to stretcher. Became unresponsive. Found to have no pulse, stopped breathing. CPR initiated at about 0140. King airway placed in field, I/O in left tibia. Patient from PEA to asystole, to vfib, to asystole. ACLS followed. Unrecoverable asystole and patient time of death 0213.	No prior vaccinations for this event.
LEFT ATRIAL DILATATION	**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased	No prior vaccinations for

shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.	this event.
LEFT VENTRICULAR DYSFUNCTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.	No prior vaccinations for this event.
LEFT VENTRICULAR FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Approximately 2 weeks post vaccination developed rapid AF, CHF. Admitted to Medical Center. Discharged home on hospice. Patient died at home on 2/13/2021. Reported to this reporter at second dose clinic on 2/16/21. Other details not known. Unknown if related to vaccine.	No prior vaccinations for this event.
LEFT VENTRICULAR HYPERTROPHY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p	No prior vaccinations for

multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. 	LEGIONELLA TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.		No prior vaccinations for this event.
	LETHARGY	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received vaccine on 1/4/2021. He was in Hospice for CHF and renal failure, but was able to get up in his wheelchair and eat and take medications and talk. On 1/5/2021 am, he was noted to be very lethargic an could only mumble, could not swallow. No localizing neurologic findings. He was too lethargic to get up in chair.		No prior vaccinations for this event.
	LETHARGY	**COVID19 (COVID19 (MODERNA)) (1201)**

"On 1/15/2021 at 1800, resident noted to be lethargic and shaking, stating ""I don't care."" repeatedly. C/O head and neck pain. T100.6. Given Tylenol with no relief of pain. Order received for Aleve and administered.. Assisted to bed as usual in evening. Monitored during night shift and noted to be resting comfortably/sleeping.. Noted agonal breathing at 4:10 AM 1/16/2021 , T 99.4, Absence of vital signs at 4:15AM 1/16/21 and death pronounced at 4:40AM 1/16/21."

No prior vaccinations for this event.

LETHARGY

COVID19 (COVID19 (MODERNA)) (1201)

Resident has increase weakness and lethargy with abnormal labs. He was transferred to the ER. He was admitted to the hospital and treated for worsening AKI and hypotension.

No prior vaccinations for this event.

LETHARGY

COVID19 (COVID19 (MODERNA)) (1201)

Resident became lethargic and reports of blood coming from resident's nose and mouth on the morning of 1/13/21. Resident went out to ER for eval, and came back to facility with dx of pneumonia and recommendations for resident to be placed on hospice. Resident deceased on 1/14/21. Unknown if vaccine related, but with timeline of events I was advised to report this per medical director of facility, as well as Pharmacy who administered the vaccine.

No prior vaccinations for this event.

LETHARGY

COVID19 (COVID19 (MODERNA)) (1201)

36 hours after vaccination, the patient had increased respiratory distress. He was placed on high flow nasal cannula oxygen with mild improvement. He then continued to be hypotensive requiring IV fluids and subsequently IV vasopressors. Patient's BP was stabilized with vasopresor, however he continued to deteriorate clinically with altered mental status and lethargy, concerned for bowel peroration based on physical exam by MD. He was then emergency intubated and placed on mechanical ventilation. He was then

No prior vaccinations for this event.

transferred to acute care hospital near by.

	LETHARGY	**COVID19 (COVID19 (MODERNA)) (1201)**
Lethargy/altered level of consciousness lead to hospital admission. Multiple interventions during hospitalization. Final hospital diagnoses: Acute respiratory failure with hypercapnia, acute pansinusitis.		No prior vaccinations for this event.

	LETHARGY	**COVID19 (COVID19 (MODERNA)) (1201)**
2/2/21-1000-patient presented to the local emergency room with complains of fever, shortness of breath and decreased oxygen sats. temp 101.7, pulse 102, respirations 36, BP 141/92, oxygen 94%. Lung sounds crackles bilaterally with rhonchi on the left. patient worked up for sepsis, CXR shows mild atelectasis. blood pressure dropped, and continued to drop through treatment requiring levophed drop to be initiated. Patient POA determined that this would not be her sister's wishes and made the decision to make patient comfort care status. 2/3/21- patient lethargic throughout night. 0640-patient demise.		No prior vaccinations for this event.

	LETHARGY	**COVID19 (COVID19 (MODERNA)) (1201)**
Within a few days, my mother started reporting profound fatigue and shortness of breath while conducting routine household activities. She no longer had to energy for her daily exercise walks and became increasingly lethargic. She died in her sleep while taking an afternoon nap on Thursday, February 4th. I am highly concerned this could be a vaccine related.		No prior vaccinations for this event.

	LETHARGY	**COVID19 (COVID19 (MODERNA)) (1201)**

30 hours after the first Covid vaccination, the resident was lethargic, non responsive with shortness of breathe.		No prior vaccinations for this event.
	LETHARGY	**COVID19 (COVID19 (MODERNA)) (1201)**
Beginning in the evening 2/19/21, fever/chills/fatigue; worsening of symptoms 2/20/21 with lethargy/lack of appetite/weakness; unable to arouse on 2/21/21 then breathing stopped, patient's spouse called 911 performed CPR, EMS continued for 15 min then while in ambulance to hospital where he was pronounced dead. Official time of death 2:20pm		No prior vaccinations for this event.
	LETHARGY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Vaccine given on 12/29/20 by Pharmacy. On 1/1/21, resident became lethargic and sluggish and developed a rash on forearms. He was a Hospice recipient and doctor and Hospice ordered no treatment, just to continue to monitor. When no improvement of codition reported, doctor and Hospice ordered comfort meds (Morphine, Ativan, Levsin). Resident expired on 1/4/2021		No prior vaccinations for this event.
	LETHARGY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Vaccine received at about 0900 on 01/04/2021 at her place of work, Medical Center, where she was employed as a housekeeper. About one hour after receiving the vaccine she experienced a hot flash, nausea, and feeling like she was going to pass out after she had bent down. Later at about 1500 hours she appeared tired and lethargic, then a short time later, at about 1600 hours, upon arrival to a friends home she complained of feeling hot and having difficulty breathing. She then collapsed, then when medics		No prior vaccinations for this event.

arrived, she was still breathing slowly then went into cardiac arrest and was unable to be revived.

LETHARGY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/14/21 - Resident complained of SOB. SPO2 66% on RA, vs 105/66-96-20 T98.2 O2 administered Pox 97% Binax test revealed (+) COVID results. Resident transferred to COVID wing. Family (HCP) updated and declined transfer to hospital Resident continued with fever, hypoxia and lethargy. Family elected CMO and Hospice notified. Resident died on 1/16/2021 @ 930AM.	No prior vaccinations for this event.
LETHARGY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
No known side effects; however, on 1/20 the decedent suffered lethargy. On 2/12/2021, the decedent had a possible seizure and was transported to emergency department where shortly after arrival, he was pronounced dead.	No prior vaccinations for this event.
LEUKAEMIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident received 1st dose on 1/4/2021. On 1/6/2021 resident having SOB, increased weakness with O2 sats at 91% RA. On 8th resident sustained a fall, O2 sats 88-92, dizzy, weakness. Rapid COVID test performed with negative results. Evening of 8th resident was lethargic and diaphoretic with fever of 99.9. Resident transferred to ER, on 5lt of oxygen. Resident returned from the ER on 1/9/2021 with new diagnosis of Leukemia and orders for hospice. Continued with fever, crackles and N/V and loss of appetite	Influenza Virus Vaccines - Unknown date/type or brand

from the 9th and 10th of January. Resident expired at 820am on 1/11/2021.

	LEUKOCYTOSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
	Died; Increased respirations (22 and labored at times); Pulse 105; 94% O2 on RA; Labored breathing at times; leukocytosis; elevated BUN; left lower lung congestion; elevated creatinine; Temperature of 102.0F; Redness on face; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced redness on face, increased respirations, labored breathing at times, temperature of 102F, pulse of 105, 94 percent O2, leukocytosis, elevated BUN, left lower lung congestion, elevated creatinine, and death. The patient's medical history, as provided by the reporter, included dementia and reduced mobility. No relevant concomitant medications were reported. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient began to experience redness on her face, increased respirations (reported as 22 and labored at times), pulse of 105, and 94 percent oxygen saturation on room air. The patient had a fever of 102 degrees Fahrenheit. Laboratory tests revealed a negative influenza swab, elevated white blood cell count of 14.1, elevated BUN at 113, and creatinine 2.7. Chest x-ray showed mild, left lower lung infiltrate. On 31 Dec 2020, the patient went under hospice care per her family request.. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2021, the cause of death was unknown.; Reporter's Comments: This case concerns a 92-year-old, female subject with medical history of dementia and reduced mobility, who experienced the serious unexpected events of death, respiratory rate increased, heart rate increased, oxygen saturation decreased, elevated BUN, elevated creatinine, left lung congestion and dyspnoea and the non-serious events of erythema and pyrexia. The events of respiratory rate increased, heart rate increased, oxygen saturation decreased, dyspnoea, erythema and pyrexia occurred 2 days after the first dose of the study medication administration, and the event of death occurred 4 days after the first dose of the study medication administration. Very limited information regarding the events is available at this time and no definite diagnosis or autopsy report have	No prior vaccinations for this event.

been provided. Additional information has been requested.; Reported Cause(s) of Death: Died

LEUKOCYTOSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
"Resident complained of feeling ""hot"" at supper time. Had emesis an hour or so later. Became hypoxic and was transferred to the hospital emergency room. Her evaluation in the ED revealed continued presence of UTI, leukocytosis (19.8), and renal insufficiency (BUN 22 Cr. 1.3) BP 99/63; P 74; Temp 98.1; RR 16; and O2 sat of 95% with 2 LPNC (she is typically on RA). CXR reported changes most consistent with CHF with cardiomegaly and bilateral pulmonary vascular prominence. Bibasilar pleural effusions greater on the right than left with pulmonary edema. Large hiatal hernia and likely old chronic wedge defromities involving the mid thoracic vertebral body. She was admitted for IV antibiotics. She expired 2/6/2021"	No prior vaccinations for this event.
LIFE SUPPORT	**COVID19 (COVID19 (MODERNA)) (1201)**
about 20+ hours after vaccination resident was having hard time breathing, 911 was called. Resident coded multiple times at the facility after CPR she was taken to ICU. She coded again and was placed on life support. Due to her choice to not be on life support she passed on 11/26/2021.	No prior vaccinations for this event.
LIFE SUPPORT	**COVID19 (COVID19 (MODERNA)) (1201)**
My Mother was given the Covid Vaccine (1st Dose) on 12/28/2020. Later that night we received a call from the nursing facility that my Mother was having uncontrollable seizures and had to be transported to the nearby hospital. The ER doctor confirmed that my Mother had tested positive to Covid. She was treated for Covid and was on life support. A few days later we received a call that my Mother had a major stroke. She passed away on January 4, 2021	No prior vaccinations for this event.

LIFE SUPPORT

COVID19 (COVID19 (MODERNA)) (1201)

Received Covid vaccine in am. Last seen by family at 17:30 pm and observed to be well. About an hour later he collapsed, unresponsive. A 911 call was initiated at 18:29. Paramedics arrived to find the patient in cardiac arrest. CPR/ACLS was initiated, but resuscitation was unsuccessful. Pt. was transported to MC where he was pronounced dead at 19:32. There was no sing of an injection site reaction, nor of allergic reaction..

No prior vaccinations for this event.

LIFE SUPPORT

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Cardiac arrest within 1 hour Patient had the second vaccine approximately 2 pm on Tuesday Jan 12th He works at the extended care community and was in good health that morning with no complaints. He waited 10-15 minutes at the vaccine admin site and then told them he felt fine and was ready to get back to work. He then was found unresponsive at 3 pm within an hour of the 2nd vaccine. EMS called immediately worked on him 30 minutes in field then 30 minutes at ER was able to put him on life support yet deemed Brain dead 1-14-21 and pronounced dead an hour or so later

No prior vaccinations for this event.

LIFE SUPPORT

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received the vaccine at an outside healthcare facility on 2/11/21. At approximately 1 pm she screamed out and fell out of her chair. EMS was called and patient was found to be in Vfib. ACLS was performed for approximately 42 minutes prior to arrival at ED. At that time the patient had been pulseless for 25 minutes. Patient received 450 mg of amiodarone, epinephrine x7, sodium bicarbonate x2, and 7 AED shocks. In the ED 3 more doses of epinephrine were given, one more dose of sodium bicarbonate, and 5 additional shocks.

No prior vaccinations for this event.

ROSC was not achieved and time of death was called at 1416.

LIMB DISCOMFORT	COVID19 (COVID19 (MODERNA)) (1201)
Passed away; tired; nonresponsive; cold; difficulty breathing; swelling; sore arm; feeling weird and funny; A spontaneous report (United States) was received from a consumer concerning a 63 year old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and the patient experienced limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal and the patient passed away . Medical history included treatment for tuberculosis and dialysis. Concomitant medication included calcium acetate, Renvela, glipizide, omeprazole, aspirin, vitamin D, losartan, furosemide, rifampin, and Sensipar. On 14 Jan 2021, the patient received the first of their first planned doses of mRNA-1273 (lot number 030L20A) for prophylaxis of COVID-19 infection. On 13 Jan2021, the patient tested negative for COVID-19). On 16 Jan 2021, the patient experienced a sore arm, and feeling weird/funny. On 17Jan2021, the patient experienced difficulty breathing and swelling. On 18 Jan 2021, the patient declined dialysis, was tired and wanted to lay down. At 8 am, the patient was found nonresponsive and cold and is believed to have passed away around 4 am. The coroner tested the deceased for COVID-19 and the test was positive. No autopsy was reported. No death certificate was issued at the time of the report but the reporter believes it will list cause of death as COVID complications. Action taken with the mRNA-1273 was not applicable. The outcome of the events of limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal, was fatal. On 18 Jan 2021, the patient was died. Cause of death was COVID-19. Autopsy details were not provided.; Reporter's Comments: The events developed on four days after first dose of mRNA-1372. Dyspnea, unresponsive to stimuli, and death were consistent with infection in pandemic set up confounded by age of patient and refusal of dialysis Cause of death was reported as COVID-19. Autopsy details were not provided. Based on reporter's causality the events are assessed as unlikely related to mRNA-1273.; Reported Cause(s) of Death: COVID-19	No prior vaccinations for this event.

	LIMB DISCOMFORT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"The resident received is vaccine around 11:00 am and tolerated it without any difficulty or immediate adverse effects. He was at therapy from 12:36 pm until 1:22 pm when he stated he was too tired and could not do anymore. The therapist took him back to his room at that time and he got into bed himself but stated his legs felt heavy. At 1:50 pm the CNA answered his call light and found he had taken himself to the bathroom. She stated that when he went to get back into the bed it was ""abnormal"" how he was getting into it so she assisted him. At that time he quit breathing and she called a RN into the room immediately. He was found without a pulse, respirations, or blood pressure at 1:54 pm. He was a DNR."		No prior vaccinations for this event.
	LIMB DISCOMFORT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
tired; legs felt heavy; stopped breathing; This is a spontaneous report from a Pfizer-sponsored program a non-contactable consumer. A 93-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 11:00 at single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Patient received vaccine around 11:00 a.m. About two hours later, he said he was tired and couldn't continue with the physical therapy he was doing. He was taken back to his room, where he said his legs felt heavy. Soon after, he stopped breathing. A nurse declared a do-not-resuscitate order. The patient died on 04Jan2021. It was not reported if an autopsy was performed. Outcome of stopped breathing was fatal. Outcome of tired and legs felt heavy was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: stopped breathing		No prior vaccinations for this event.
	LIMB INJURY	**COVID19 (COVID19**

	(PFIZER-BIONTECH)) (1200)
Patient was tested for covid on 2/2/21 with positive resulted. Presented to Hospital ER on 2/10/21 with c/o of abdominal pain. Diagnosed with gastritis, prescribed metoclopromide and famotidine and dc home. Returned to ER on 2/13/21 with c/o of weakness, diarrhea, foot ulcer, and loss of appetite. Diagnosed: 1) Dyspnea and hypoxia secondary to Covid-19 2) Extensive bilateral lung infiltrates secondary to Covid-19 3) Increased Cr 4) Increased LFTs, ferritin, d-dimer, troponin secondary to Covid-19 5) Elevated procalcitonin placing the patient at high risk for sepsis 6) Chronic appearing Right foot wound without signs of secondary infection Patient transferred to a different hospital in another city.	No prior vaccinations for this event.
LIMB MASS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
L hand edema, hematoma which burst and caused bleeding sending pt to the ER for pressure dressing and 2 stitches. L hand and arm progressively got more edematous and bruised looking (severely black/blue/purple) and the hand continued to bleed and swell on 2/6/21. Severe arterial and venous issues and apparent blood clots. On 2/7/21 there were also lumps noted on left inner thigh. Pt. stopped eating or drinking on 2/8/21 and expired on 2/12/21.	No prior vaccinations for this event.
LIP BLISTER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"The day after the 2nd shot, patient developed blisters on his lips and mouth. The care facility said that he had a nut allergy -- but he had never been allergic to nuts. He stopped eating and drinking and his BP had dropped to 60/40. By Jan 16th they called to say he was dying and he passed away on 1/18/21. Patient had COVID19 from Oct 29th - early November. By Nov 21st he had lost 40 lbs. He	Shingles - Glaxo 8/22/2020, resulted in hospitalization and LTC.

was 6'3"" and had gone from 189lbs to 149 lbs with COVID. By Nov 21st when we could visit, he had recovered from COVID, but was very thin and weak. He could not bathroom alone and kept falling. He didn't seem to have a bad reaction to the 1st COVID shot, But he immediately reacted to the 2nd shot and passed away within 6 days."

LIPASE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status:

No prior vaccinations for this event.

SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

LISTLESS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

24 hours after shot had high fever 101, chills, weakness, became listless, family called 911, client became unresponsive and died in the Emergency room.

No prior vaccinations for this event.

LIVEDO RETICULARIS

COVID19 (COVID19 (MODERNA)) (1201)

"Pt. woke up the next morning after vaccination and ""didn't feel well"", described by wife as fatigue, no energy. At approximately 2 PM, he vomited. His wife checked on him at 4:20 PM and he wasn't breathing sitting in his chair. EMS squad was called but when they arrived he was asystole and mottling present. Did not start CPR since he was already gone too long. Pronounced by coroner on scene."	No prior vaccinations for this event.	
LIVEDO RETICULARIS		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
No adverse effects from vaccination seen on 1/2/21. On 1/6/21 resident was seen by Dr and her baclofen pump was refilled with 20 ml Baclofen 4,000mcg/ml. ITB Rate increased by 6% to 455.5 mcg/day simple continuous rate over 3 days. On 1/8/21 at 0615 resident was shaking, lower extremities mottled, Sa02 70%, pulse 45. Oxygen started at 2 L/m per NC. At 0715 her primary physician was notified as well as her daughter. Oxygen increased to 4 L/min, sats at 83%. SOA noted, reported all over pain. At 0850 when they attempted to reposition the resident, she was not responsive. Licensed nurse assessed her and no heartbeat heard or pulse found.	No prior vaccinations for this event.	
LIVEDO RETICULARIS		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
No reactions immediately after vaccine was given. Resident has dementia, has had multiple hospitalizations related to a renal stone recently. Had a tooth that was bothering her, went to see her dentist and it was extracted on 1/6/21. On 1/10 they noted feet and ankles are dark purple with white splotches appears to be mottling. Minimally responsive to voice and touch. Not eating. Compassionate visit with family. Family did not want hospice, did not feel it was needed, said, what more could they do for her than you're already doing? On 1/11 at 1950 was determined to be deceased.	No prior vaccinations for this event.	

LIVEDO RETICULARIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient noted to have a change in status at 11:23PM that night. Her oxygen saturation had dropped from normal on room air to 82% and required oxygen. She was also noted to be lethargic with altered mental status and not responding verbally. She then began to mottle. Her oxygen saturation worsened to 51% on 4Liters of oxygen by the next day and she expired on 1/14/21.	No prior vaccinations for this event.
LIVER FUNCTION TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
vomiting later on 01/05/21. Lethargy and hypoxia in pm of 01/06/21. Hypotension am of 01/07/21. Hospitalized, intubated, cardiac arrest, died 01/07/21.	No prior vaccinations for this event.
LIVER FUNCTION TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total	No prior vaccinations for this event.

bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

LIVER FUNCTION TEST ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

She had pain in the injection site Tuesday night and then during Tuesday she got worse with nausea and some fever. By Wednesday she was complaining that she could not pee even though she was drinking a lot of fluids. She continued to complain it was the worst she ever felt and then at 0600 Thursday morning she woke us up and said she needed to go to the hospital. We arrived at the hospital just before 0700 and she immediately threw up in the trash can. We went into a treatment room and they took blood and started fluids as she became incoherent. She said she had taken Tylenol so they started a drug to counter that but her liver function was all wrong and they started to look for a hospital that could transplant a liver. She was air evade about 0930 to Medical center and just over 30 hours latter she was dead. There is a pending autopsy. She was a healthy 39 year old mother who got the shots because she worked as a surgical tech and she was the single mother of a 9 year old little girl.

No prior vaccinations for this event.

LIVER FUNCTION TEST ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

PATIENT GOT HER FIRST COVID PFIZER VACCINE AT 12/31 IN THE AM. HAD GOTTEN FLU LIKE SYMPTOMS AND HAD BEEN SICK FOR A COUPLE OF DAYS. HAD NAUSEA AND VOMITTING DURING THIS TIME AS WELL. ON 1/3 THE CARE GIVER WENT TO CHECK ON HER PT AT HER LTC FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.	No prior vaccinations for this event.
LIVER FUNCTION TEST ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Approximately 2 weeks post vaccination developed rapid AF, CHF. Admitted to Medical Center. Discharged home on hospice. Patient died at home on 2/13/2021. Reported to this reporter at second dose clinic on 2/16/21. Other details not known. Unknown if related to vaccine.	No prior vaccinations for this event.
LIVER FUNCTION TEST INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was tested for covid on 2/2/21 with positive resulted. Presented to Hospital ER on 2/10/21 with c/o of abdominal pain. Diagnosed with gastritis, prescribed metoclopromide and famotidine and dc home. Returned to ER on 2/13/21 with c/o of weakness, diarrhea, foot ulcer, and loss of appetite. Diagnosed: 1) Dyspnea and hypoxia secondary to Covid-19 2) Extensive bilateral lung infiltrates secondary to Covid-19 3) Increased Cr 4) Increased LFTs, ferritin, d-dimer, troponin secondary to Covid-19 5) Elevated procalcitonin placing the patient at high risk for sepsis 6) Chronic appearing Right foot wound without signs of secondary infection Patient transferred to a different hospital in another city.	No prior vaccinations for this event.

LIVER FUNCTION TEST NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."		No prior vaccinations for this event.
LOCALISED OEDEMA		**COVID19 (COVID19 (MODERNA)) (1201)**
Redness and warmth with edema to right side of neck and under chin. Resident was on Hospice services and expired on 1.1.21		No prior vaccinations for this event.
LOSS OF CONSCIOUSNESS		**COVID19 (COVID19**

(MODERNA)) (1201)

Patient received her first dose of the Moderna COVID-19 Vaccination on Saturday January 16th 2021 at approximately 12pm. She completed all necessary screening forms and was deemed to be at low risk for serious allergic reactions. She tolerated the vaccination well, and no complications or immediate adverse events occurred. She was observed for a full 15 mins per CDPHE/CDC guidelines and left the Clinic in stable condition after her observation period was complete. On the morning of Tuesday, January 19th, 2021, the patient was found unconscious and unresponsive by her husband. She was transferred by Ambulance to Hospital shortly thereafter. She was diagnosed with a brain bleed that was determined to be inoperable. She was transferred to other Hospital for higher level care. She was seen by neurosurgery and diagnosed with a ruptured aneurysm. She was treated in the ICU for 24 hours, at which point her team determined that the severity of her brain bleed would not respond to treatment. Supportive cares were withdrawn on Wednesday Jan 20th, and she passed away shortly thereafter.

No prior vaccinations for this event.

LOSS OF CONSCIOUSNESS

COVID19 (COVID19 (MODERNA)) (1201)

Rapid decline in health status, Elevated BP&P, posturing, loss of consciousness, Glasgow coma Scale 4 starting 2/1/2021, Deceased 2/3/21

No prior vaccinations for this event.

LOSS OF CONSCIOUSNESS

COVID19 (COVID19 (MODERNA)) (1201)

Brain aneurysm; Anaphylactic reaction; Collapsed; BP sky rocketed; Shortness of breath; A spontaneous report was received from a consumer concerning a 69-year-old female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced blood pressure skyrocketed, shortness of breath, loss of consciousness, massive anaphylactic reaction, and brain aneurysm. The patient's medical history, as provided by the reporter, included high blood pressure and arthritis. Products known to have been used by the patient, within two weeks prior to the event, included an antihypertensive. On 04 Jan 2021, prior to the onset

No prior vaccinations for this event.

of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. Twenty-two minutes later she had a massive anaphylactic reaction. She experienced shortness of breath, blood pressure skyrocketed, and loss of consciousness. She was taken to the emergency room. The patient had a brain aneurysm and never recovered. No treatment information was provided. The patient died on 04 Jan 2021. The cause of death was reported as brain aneurysm. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns a 69-year-old, female patient with a medical history of hypertension, who experienced fatal, serious, unexpected events of Anaphylactic reaction, hypertension, dyspnea, loss of consciousness and brain aneurysm. The events occurred 22 minutes after the first dose of mRNA-1273 was administered. No treatment information was provided. The patient never recovered and died. The cause of death was reported as brain aneurysm. Very limited information regarding this event has been provided at this time. Based on temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Additional information has been requested.; Reported Cause(s) of Death: Brain aneurysm

LOSS OF CONSCIOUSNESS

COVID19 (COVID19 (MODERNA)) (1201)

Patient found down at home with agonal respirations and per EMS asystole, received 2 rounds of epi at her house with return of spontaneous pulses, lost pulse again in route to ER and another round of epi was given, CPR in progress when arrived at hospital. Prior to this patient's husband states he heard her fall in the bathroom but did not immediately check on her as he states that this has happened before. He checked on her 10 min later and that's when he found her unconscious. Daughter called 911 and she began CPR. No previous complaints of headache, chest pain, back pain, fever or chills. Husband states patient was drinking that evening which is not unusual for her. Patient died at hospital.

No prior vaccinations for this event.

Passed away; Found unconscious; Coma; Lack of oxygen to the brain; A spontaneous report was received from a consumer, concerning his mother, a 71-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and passed away, prior to death, patient experienced lack of oxygen to the brain and was found unconscious and went to coma. The patient's medical history reported included seizures. Concomitant medications included phenobarbital, lamotrigine and levetiracetam. On 27 Jan 2021, approximately six days prior to the onset of events, the patient received their first of two planned doses of mRNA-1273 (lot number: 030L20A) intramuscularly for prophylaxis of COVID-19 infection. On 01 Feb 2021 at 4 am, the patient was found to be unconscious on the couch, hence she was rushed to the hospital with lack of oxygen to the brain. Later, she went into a coma, hence she was in hospital for 30 hours and then was transferred to a different hospital for a second opinion on 06-Feb-2021, where she was passed away at 02:20 PM. Treatment information was not provided Action taken with mRNA-1273 in response to the events were not applicable. The outcome of events, lack of oxygen to the brain, found unconscious and coma were	No prior vaccinations for this event.

considered unknown. The outcome of event passed away was fatal as she died on 06 Feb 2021 at 2:20 pm. The cause of death was not provided. Plans for an autopsy were unknown.; Reporter's Comments: This is a case of 71-year-old female subject with a history of seizures who died 6 days after receiving first dose of vaccine. Very limited information has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Passed away		
LOSS OF CONSCIOUSNESS		**COVID19 (COVID19 (MODERNA)) (1201)**
I am the patient's daughter as well as an RN-BSN. My mother was given the Moderna vaccine on Feb 11, 2021 and on Feb 15, 2021 she had a CVA and MI. She was found on her apt. floor unconscious. She was transferred to the Hospital by ambulance where a CT scan and other tests were done. It was determined she had a stroke and heart attack. My mother was in great health, took no medications, and lived alone in her apt. before this incident. The medical professionals determined she would not recover so she was admitted to hospice and died on Feb. 21, 2021. I believe there is a relationship between the vaccine and the CVA and MI. loss of consciousness; respiratory distress Narrative: Patient tolerated his 1st dose of the COVID-19 vaccine well, on 12/16/2020, and received his 2nd dose on 1/6/2021. Patient had some mild clinical decline the past few days prior to 2nd vaccination, with a decreased appetite and some increased fatigue per nursing report, but no significant changes. He experienced nausea on the evening of 1/6/21, which was effectively managed, but by early morning he spiked a fever of 102.9 with a sat of 86.1%. He continued to deteriorate from that point on and died 1/7/21 @13:20. Clinically, the presentation was most consistent with an aspiration pneumonia.	No prior vaccinations for this event.	
LOSS OF CONSCIOUSNESS		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient with history advanced vascular dementia, hypertensive cerebrovascular disease and stroke, T2DM. Received her second dose of Pfizer COVID-19 vaccine at approximately 14:00 and was reported to have expired at home at 20:55. Dr. (Medical Director) spoke with patient's son/caregiver 2/4/21. Son reports that patient was in her usual health yesterday morning, deemed well enough by son to travel for vaccination. He reports she had no bothersome symptoms after either first or second vaccinations. Specifically denied rash, wheeze, and difficulty breathing. Son was with patient throughout the day. In the evening, when preparing for bed, he noted she became suddenly unresponsive in a similar fashion as she has done several times in past years. While in all previous such episodes she recovered within minutes, last evening she did not regain consciousness, experiences a brief period of labored breathing, and died. Patient's son called 911 and the patient's body was brought to the medical examiners. The medical examiner declined to proceed with autopsy. Patient's son is not interested in autopsy. Patient's son reports confidence that his mother's underlying hypertensive/diabetic cardiovascular disease is the natural cause of her death. Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an		No prior vaccinations for this event.

unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in

the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second

COVID-19 Vaccine.; Reported Cause(s) of Death: Death

Day After - severe headache, 2 days after headache continues, itchy scalp, day 3 rash visible at hair line headache continues, more confusion than normal, day 4 on site nurses check rash and think it is dermatitis, day 5 continues to get work nurse practitioner was to visit next day, day 6 NP thinks that she has UTI and sends her to hospital (2/11/21). Hospital determines - Rash is Shingles, UTI present, - MRSA is now present in shingles which is on right back of head and right neck and face. Next Sepsis is diagnosed. Since 2/11/21 patient was not conscious. 2/20/21 famiy is notified that she should be moved to Hospice. Moved to hospice on 2/20/21. The patient, my mother, died on 2/23/21 official cause of death is UTI.	No prior vaccinations for this event.

LOSS OF CONSCIOUSNESS	COVID19 (COVID19 (UNKNOWN)) (1202)
Patient was admitted to hospital from home in cardiac arrest. Hx of hypertension, hyperlipidemia, type 2 diabetes (not on insulin) and bilateral carotid artery stenosis. The patient was reportedly at his baseline health on 2/2/21. He received the 2nd dose of COVID vaccine around 1000AM on 2/2/21. Reportedly started running fever of 100.1 and chills the afternoon of 2/2/21. Around 7:00PM he started having dry cough and was complaining of breathing difficulties. He subsequently vomited multiple times (was eating pizza and aspirated) then lost consciousness. His wife called 911, did CPR and EMS reported he in PEA at scene and was	No prior vaccinations for this event.

intubated. Transported to hospital. SARS CoV-2 and influenza negative.

LOSS OF CONSCIOUSNESS	COVID19 (COVID19 (UNKNOWN)) (1202)
Received first SARS-CoV2 vaccination yesterday at local store Experienced new symptoms of chills, nausea as well as worsening from baseline dyspnea at night. Wife states he had rough morning breathing and had sudden loss of consciousness and unresponsiveness and failed to respond to bystander CPR. He expired at his home.	No prior vaccinations for this event.

LOSS OF PERSONAL INDEPENDENCE IN DAILY ACTIVITIES	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Patient received her first covid vaccine on 1/27/21. on 1/30/21 she presented to the emergency department complaining of nausea, she had a negative work up, felt better and was sent home. on 2/5/21 she returned to the emergency department more ill-appearing and complaining of ""feeling sick"". she had fatigue, chills, decrease in activity level. her work up at this visit revealed multiple metabolic abnormalities, sepsis and bacteremia. She ultimately passed away at this visit with at cause of death listed as acute liver failure, pneumonia, and DIC>"	No prior vaccinations for this event.

LOW DENSITY LIPOPROTEIN NORMAL	COVID19 (COVID19 (MODERNA)) (1201)
While at counseling appointment on February 17 patient had witnessed sudden cardiac arrest and was not able to be resuscitated. She was pronounced dead at 12:09. At the time of death her glucose was about 500.	No prior vaccinations for this event.

LOWER URINARY TRACT SYMPTOMS		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."		No prior vaccinations for this event.

LUNG CARCINOMA CELL TYPE UNSPECIFIED STAGE IV		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Received Pfizer 1/22/2021. RNA+ 2/4/2021. S/S SOB, cough, confusion. COVID assoc. resp. failure, stage 4 lung cancer, COPD, HTN, former smoker. patient in hospice and died 2/10/2021.		No prior vaccinations for this event.

LUNG CONSOLIDATION		**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.		No prior vaccinations for this event.
LUNG CONSOLIDATION		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.		No prior vaccinations for this event.
LUNG DISORDER		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC

No prior vaccinations for this event.

pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

LUNG INFILTRATION

COVID19 (COVID19 (MODERNA)) (1201)

12/30/2020 07:02 AM Resident noted to have some redness in face and respiration were fast. Resident vital signs were abnormal except blood pressure. Temp at the time was 102.0 F taken temporal. Resident respirations were 22 labored at times. Pulse is 105 and pulse ox 94% on room air. Resident is made comfortable in bed. Notified triage of change in condition also made triage aware of resident receiving Covid vaccination yesterday morning. Resident appetite and fluid consumption has been poor for few days. 12/30/2020 07:32 AM Received order from agency to administer Acetaminophen 650mg suppos rectally due to resident not wanting to swallow anything including fluids, medications and food. This writer administered medication as NP ordered. Will monitor for effectiveness and adverse effects if any. 12/30/2020 08:41 AM Received new orders to obtain Flu swab, obtain CBC and BMP, and Chest Xray all to be obtained today. Notified family of resident having temperature and vital signs excluding b/p that was abnormal. Family was thankful for call and inierated to nurse that family does not want resident sent to hospital. Did educate family on benefits of Hospice services, but family persistant on continued daily care provided by nursing staff. Requests visits if decline continues. Family assured if resident continues to decline, facility will accomandate

No prior vaccinations for this event.

resident family to be able to be at bedside when time comes to do so. NP ordered IVF and IV Levaquin on 12/31/20. Family chose at that time to sign for Hospice services and not have resident provided with IVF or IV Antibiotics

	LUNG INFILTRATION	**COVID19 (COVID19 (MODERNA)) (1201)**
UNKNOWN/ASYTOLE Narrative: Please refer to section 6. 68y/o male with h/o severe peripheral vascular disease with previous left AKA 2/3/20, s/p bilateral bypasses in the past. Pt recently underwent right AKA on 1/12/21. Per Hospital remote data 1/10/21 pt c/o shortness of breath, CXR demonstrated right lower lobe opacity & left basilar infiltrate. Pt s/p >10 days emperic IV abx. Moderna vaccine 0.5ml IM was administered via left deltoid on 1/22/21 around 16:21. On 1/23/21@05:14 code blue was called as pt found to be unresponsive, breathless and pulseless, facial cyanosis noted, CPR started immediately.Pt found to be in asystole. ACLS guideline followed but no return of spontaneous circulation, At 05:32 pt remained pulseless and breathless and was pronounced. Autopsy currently pending.		No prior vaccinations for this event.
	LUNG INFILTRATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.		No prior vaccinations for this event.
	LUNG INFILTRATION	**COVID19 (COVID19**

Died; Increased respirations (22 and labored at times); Pulse 105; 94% O2 on RA; Labored breathing at times; leukocytosis; elevated BUN; left lower lung congestion; elevated creatinine; Temperature of 102.0F; Redness on face; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced redness on face, increased respirations, labored breathing at times, temperature of 102F, pulse of 105, 94 percent O2, leukocytosis, elevated BUN, left lower lung congestion, elevated creatinine, and death. The patient's medical history, as provided by the reporter, included dementia and reduced mobility. No relevant concomitant medications were reported. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient began to experience redness on her face, increased respirations (reported as 22 and labored at times), pulse of 105, and 94 percent oxygen saturation on room air. The patient had a fever of 102 degrees Fahrenheit. Laboratory tests revealed a negative influenza swab, elevated white blood cell count of 14.1, elevated BUN at 113, and creatinine 2.7. Chest x-ray showed mild, left lower lung infiltrate. On 31 Dec 2020, the patient went under hospice care per her family request.. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2021, the cause of death was unknown.; Reporter's Comments: This case concerns a 92-year-old, female subject with medical history of dementia and reduced mobility, who experienced the serious unexpected events of death, respiratory rate increased, heart rate increased, oxygen saturation decreased, elevated BUN, elevated creatinine, left lung congestion and dyspnoea and the non-serious events of erythema and pyrexia. The events of respiratory rate increased, heart rate increased, oxygen saturation decreased, dyspnoea, erythema and pyrexia occurred 2 days after the first dose of the study medication administration, and the event of death occurred 4 days after the first dose of the study medication administration. Very limited information regarding the events is available at this time and no definite diagnosis or autopsy report have been provided. Additional information has been requested.; Reported Cause(s) of Death: Died

No prior vaccinations for this event.

	LUNG INFILTRATION	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.		No prior vaccinations for this event.

	LUNG INFILTRATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
vomiting later on 01/05/21. Lethargy and hypoxia in pm of 01/06/21. Hypotension am of 01/07/21. Hospitalized, intubated, cardiac arrest, died 01/07/21.		No prior vaccinations for this event.

	LUNG INFILTRATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in		No prior vaccinations for this event.

triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

LUNG INFILTRATION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient developed 104.4 temp approximately 48 hours after being given the vaccine. I treated him with antibiotics, IV fluids, cooling methods. CXR does show a new right perihilar infiltrate. However, his fever came down within the next 24-48 hours. Unfortunately, he suffered a cardiac arrest on 1/21/21 in the early morning and expired.

No prior vaccinations for this event.

LUNG INFILTRATION

COVID19 (COVID19

(PFIZER-BIONTECH))
(1200)

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel

No prior vaccinations for this event.

can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the

steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

LUNG INFILTRATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"	No prior vaccinations for this event.

	LUNG INFILTRATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received first dose of vaccine on 1/7/21 at a community Public Health clinic. On 1/29/21 he received a second dose at the community Public Health clinic. On 2/5/21, the patient presented to the ED with complaints of shortness of breath worsening over the last 2 weeks. Patient reported that he had decreased exercise capacity and increased coughing with sputum production intermittently. Patient reported that he had been feeling chilled, but no fevers. Patient was admitted and treated with Decadron and Remdesivir. Patient experienced increased oxygen requirement. Patient was a DNI and did not want to be on life support. After discussion with the patient and family, patient was moved to comfort care. passed away on 2/11/21.		No prior vaccinations for this event.
	LUNG INFILTRATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was tested for covid on 2/2/21 with positive resulted. Presented to Hospital ER on 2/10/21 with c/o of abdominal pain. Diagnosed with gastritis, prescribed metoclopromide and famotidine and dc home. Returned to ER on 2/13/21 with c/o of weakness, diarrhea, foot ulcer, and loss of appetite. Diagnosed: 1) Dyspnea and hypoxia secondary to Covid-19 2) Extensive bilateral lung infiltrates secondary to Covid-19 3) Increased Cr 4) Increased LFTs, ferritin, d-dimer, troponin secondary to Covid-19 5) Elevated procalcitonin placing the patient at high risk for sepsis 6) Chronic appearing Right foot wound without signs of secondary infection Patient transferred to a different hospital in another city.		No prior vaccinations for this event.
	LUNG INFILTRATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.	No prior vaccinations for this event.
LUNG INFILTRATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric	No prior vaccinations for this event.

treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his

stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

UNKNOWN/ASYTOLE Narrative: Please refer to section 6. 68y/o male with h/o severe peripheral vascular disease with previous left AKA 2/3/20, s/p bilateral bypasses in the past. Pt recently underwent right AKA on 1/12/21. Per Hospital remote data 1/10/21 pt c/o shortness of breath, CXR demonstrated right lower lobe opacity & left basilar infiltrate. Pt s/p >10 days emperic IV abx. Moderna vaccine 0.5ml IM was administered via left deltoid on 1/22/21 around 16:21. On 1/23/21@05:14 code blue was called as pt found to be unresponsive, breathless and pulseless, facial cyanosis noted, CPR started immediately.Pt found to be in asystole. ACLS guideline followed but no return of spontaneous circulation, At 05:32 pt remained pulseless	No prior vaccinations for this event.

and breathless and was pronounced. Autopsy currently pending.

	LUNG OPACITY	**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.		No prior vaccinations for this event.
	LUNG OPACITY	**COVID19 (COVID19 (MODERNA)) (1201)**
ER visit 1/25/21 patient walked into a prompt care and collapsed, witnessed and pulseless CPR with ROSC after 6-7mins, no shock no meds. Awake and speaking upon arrival to ER. 2 plus pitting edema ble ER diagnosis Anasarca, cardiac arrest, hypotension, elevated troponin I levels, Acute kidney injury and syncope. ER notes reveal a syncopal episode in the shower prior to collapse at prompt care. Central line placed and plan to ship to another facility, patient continued to decline despite dopamine and dobutamine expired in ER prior to transfer.		No prior vaccinations for this event.
	LUNG OPACITY	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with		No prior vaccinations for this event.

improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

COVID19 (COVID19 (MODERNA)) (1201)

Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).

No prior vaccinations for this event.

LUNG OPACITY	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a	No prior vaccinations for this event.

possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced

pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM. Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with	No prior vaccinations for this event.

labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

LYMPHOCYTE COUNT NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and		No prior vaccinations for this event.

had fixed unreactive pupils. He was pronounced at 16:13.

LYMPHOCYTE COUNT NORMAL	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild	No prior vaccinations for this event.

patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her

No prior vaccinations for this event.

stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

Patient woke up on the morning of 2/6 with symptoms of a stroke. Rushed to hospital where clot found in brain. Recovered from initial stroke but then had another major stroke on 2/8 and never recovered. | No prior vaccinations for this event.

MAGNETIC RESONANCE IMAGING ABNORMAL | **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Day after receiving the vaccine, the patient complained of abdominal pain which worsened over the day. She went to the ED and was hospitalized. Abdominal pain complaints increased and continued, she decompensated rapidly, was intubated and subsequently died 3 days later. Imaging results showed, progressive ovarian cancer in the bowels. Blood culture revealed that she had E.Coli in her blood. It is thought that this is NOT related to the vaccine. | No prior vaccinations for this event.

MAGNETIC RESONANCE IMAGING ABNORMAL | **COVID19 (COVID19 (PFIZER-BIONTECH))**

(1200)

After the second vaccine dose she reported not feeling well with unspecified symptoms for a few days. On February 18th, 2021 she visited her doctor with numbness in her hand. They thought it may be carpal tunnel and sent her home. The morning or March 18th , 2021 she had a severe stroke and was transferred to Hospital and then to other hospital. She was in the hospital until Tuesday March 23rd when she was transferred back to her home for hospice care. She died on March 26th, 2021.

No prior vaccinations for this event.

MAGNETIC RESONANCE IMAGING BRAIN ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

"This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21."

Two days later passed away; difficulty breathing, shortness of breath; difficulty breathing, gurgling; Not feeling well; Achiness; Severe fever; Chills; A spontaneous report was received from a physician concerning a 56-year-old female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed fever, chills, achiness, shortness of breath, gurgling and unresponsive. The patient's medical history was not provided. Concomitant product use was not provided. On 19 Jan 2021, prior to the onset of the events, the patient received their second of two planned doses of mRNA-1273 (Lot 042L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. After receiving the vaccine on 19 Jan 2021, the patient experienced fever, chills, shortness of breath, gurgling and achiness. On 21 Jan 2021, the patient was found unresponsive. Emergency medical services were called to perform life saving measures however, they were unsuccessful. No further treatment information was provided. The patient died on 21 Jan 2021. The cause of death was reported as unknown. An autopsy was planned.; Reporter's Comments: This case concerns a 56-year-old, female, who experienced a serious event of death, with many other events after receiving second dose of mRNA-1273 (Lot# 042L20A). Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death		No prior vaccinations for this event.
	MALAISE	**COVID19 (COVID19 (MODERNA)) (1201)**
She had pain in the injection site Tuesday night and then during Tuesday she got worse with nausea and some fever. By Wednesday she was complaining that she could not pee even though she was drinking a lot of fluids. She continued to complain it was the worst she ever felt and then at 0600 Thursday morning she woke us up and said she needed to go to the hospital. We arrived at the hospital just before 0700 and she immediately threw up in the trash can. We went into a treatment room and they took blood and started fluids		No prior vaccinations for this event.

as she became incoherent. She said she had taken Tylenol so they started a drug to counter that but her liver function was all wrong and they started to look for a hospital that could transplant a liver. She was air evade about 0930 to Medical center and just over 30 hours latter she was dead. There is a pending autopsy. She was a healthy 39 year old mother who got the shots because she worked as a surgical tech and she was the single mother of a 9 year old little girl.

MALAISE		**COVID19 (COVID19 (MODERNA)) (1201)**
"The patient came to the Emergency Room at approx 3:30 am on 02/03/2021 with pain in right arm (same arm the COVID vaccine had been administered in approx 12 hours earlier) and feeling generally unwell. Patient was concerned about possibility of gout flare or that something was wrong with her arm. Elevated blood pressure was noted; this was attributed to anxiety. She was evaluated, given 500 mg Tylenol, and discharged since the pain was decreasing and blood pressure was stabilized. Patient instructed to follow-up with physician. The next day, on 02/04/2021, the patient arrived at the Emergency Room by ambulance; cardiac arrest was the chief complaint. The patient's daughter stated the patient had been ""feeling generally poor and then suddenly collapsed."" Daughter described ""gurgling respirations"" and being unresponsive. 911 was called, police arrived within 5 minutes and initiated CPR. Epinephrine, atropine, lidocaine and bicarb administered after arrival to Emergency Room. Shockable rhythm never demonstrated. Patient never recovered spontaneous respiration or movement. The death was called at 23:04. Coronary artery disease with cardiac arrest is the cause from the ER records; the coroner is putting COVID-19 vaccination in Part 1 of the death certificate." MALAISE	COVID19 (COVID19 (MODERNA)) (1201)
Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia	No prior vaccinations for this event.

he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient

No prior vaccinations for this event.

was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

He felt worse on 20Feb; On 19Feb, he began to feel ill again with a fever. He felt worse on 20Feb; fever; headache; stomach upset; This is a spontaneous report from a contactable consumer reporting for the father: A 75-year-old male patient received the 1st dose of bnt162b2 (BNT162B2, Lot # EL3428) at single dose at left arm on 03Feb2021 for Covid-19 immunisation. Medical		No prior vaccinations for this event.

history included type 2 diabetes mellitus. No known allergies. The patient had not experienced Covid-19 prior vaccination. Concomitant medication in 2 weeks included amitriptyline hydrochloride (manufacturer unknown) 10 mg, atorvastatin (manufacturer unknown) 20 mg, dutasteride (manufacturer unknown) 0.5 mg, linaclotide (LINZESS) 290 mcg, gabapentin (manufacturer unknown) 300 mg, montelukast (manufacturer unknown) 10 mg, ramipril (manufacturer unknown) 5 mg, insulin degludec (TRESIBA) 100 unit/ml, liraglutide (VICTOZA) 18 mg/3ml solution. No other vaccine in 4 weeks. The patient experienced cardiac arrest due to pericardial effusion on 21Feb2021 14:15, fever on 13Feb2021, headache on 13Feb2021, stomach upset on 13Feb2021, on 19feb, he began to feel ill again with a fever, he felt worse on 20feb on 19Feb2021, on 21feb he went to the ER after vomiting and passing out on 21Feb2021. Events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of cardiac arrest due to pericardial effusion. Course of events: In Feb2021, 10 days after his 1st injection, the patient developed fever, headache, and stomach upset. He went for a rapid Covid-19 test (nasal swab) and it was negative on 11Feb2021. The doctor told him he might be having a delayed reaction to the vaccination. After a couple of days, he improved. On 19Feb2021, he began to feel ill again with a fever. He felt worse on 20Feb2021. On 21Feb2021 he went to the ER after vomiting and passing out and received treatment: IV fluids, diagnostic testing at ER. Rapid Covid test (nasal swab) at ER came back negative again on 21Feb2021. His heart arrested suddenly and he could not be resuscitated. CT scan results, that came back after death, showed Covid like pneumonia and pericardial effusion. The patient died on 21Feb2021 14:15. Cause of death was cardiac arrest due to pericardial effusion. An autopsy was not performed. The outcome of cardiac arrest due to pericardial effusion was fatal, of fever, headache, stomach upset was recovering, of he began to feel ill again with a fever, he felt worse was not recovered, of he went to the ER after vomiting and passing out was unknown.; Reported Cause(s) of Death: cardiac arrest due to pericardial effusion; cardiac arrest due to pericardial effusion

MALAISE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received the vaccine around 11 am. He hadn't been feeling well (headache, dizziness) per report and initially called in to work. He then decided to come to work and was found down in a patient bathroom during his shift on our Facility while taking care of a patient (he was a nurse aid). Patient was coded and the team and was transferred to our Facility ED. He expired 3/3 2112	No prior vaccinations for this event.
MASTICATION DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/7/21 Increased difficulty chewing, swallowing, evaluated by SLP and dietician. Diet texture down-graded x 2 with poor appetite and recent 6lb weight loss. 2/8/21-APRN updated regarding poor appetite and difficulty chewing as well as downgraded texture of diet. Also informed of increased s/s of discomfort and increased use of PRN Oxycodone for pain. 2/9/21- elevated temp 100.7. 2/9/21 Covid pcr test negative. 2/9/21- N.O.?s APRN BMP, Albumin and Pre-albumin Level in am. 2/11/21-elevated temp 100.4. Covid rapid test negative. 2/12/21- CBG recorded at 517 at 5:20 am. Resident also has an elevated temp of 100.9. Tylenol administered per order. Vital signs include resp 24, radial pulse 134, O2 sat 83%. Supplemental oxygen administered via nasal cannula. Head of bed elevated. DR. notified at time via telephone. Order given for sliding scale for CBG. Guardian updated regarding changes in residents condition, poor prognosis. Guardian requests Hospice eval and admit. Guardian requests comfort care no hospitalization, no IV's, no G-tubes, no labs etc, D/C of Palliative services. ARNP informed. 2/12/21 Acute Telehealth visit with APRN due to increased lethargy, elevated CBG?s despite poor appetite and insulin administration. Resident unresponsive to verbal and noxious stimuli at time of visit. N.O. Morphine sulfate 20mg/ml, give 2.5mg PO/SL Q4hr PRN pain/shortness of breath. 2/12/2021-Admitted to Hospice, Lethargic, diaphoretic, T 98.1 P 130's R 18 O2 high 80's to low 90's via O2 mask at 3L. 2/12/2021- Resident legs and arms noted to feel cool this afternoon, 02 sat was 97% with 02 on @ 3L with mask Noted resident with sob and increased pulse. Prn morphine 0.25ml sl. given with good effect. Resident was less restless and quiet in her bed. Checked on resident several times this shift for needs. Resident noted to not move in her bed @ 8:15pm	No prior vaccinations for this event.

and noted she was not breathing. Supervisor called and pronounced resident deceased.

MATERNAL EXPOSURE DURING PREGNANCY	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Maternal exposure during pregnancy; Fetus stopped growing on 09Feb21 (8w4d); no heartbeat detected; This is a spontaneous report from a contactable consumer (parent). This consumer reported information for both mother and fetus. This is a fetus report. A patient of unspecified age and gender (fetus) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9269), transplacental on 04Feb2021 at 14:00 at single dose for COVID-19 immunisation. The patient medical history was not reported. Concomitant medication included ergocalciferol (VIT D), folic acid (FOLATE), ascorbic acid/betacarotene/calcium sulfate/colecalciferol/cyanocobalamin/ferrous fumarate/folic acid/ nicotinamide/pyridoxine hydrochloride/retinol acetate/riboflavin/thiamine mononitrate/tocopheryl acetate/zinc oxide (PRENATAL VITAMINS) and sertraline hydrochloride (ZOLOFT) at 25 mg, all transplacental. It was reported that OB exam on 03Feb21 showed healthy baby at 7weeks 5days heartbeat detected 152 bpm; no abnormalities identified via ultrasound; labs and hormone levels all within normal ranges. No issues detected. Mother received 1st dose of vaccine on 04Feb2021. Per ultrasound on 20Feb2021, fetus stopped growing on 09Feb2021 (8 weeks 4 days); no heartbeat detected. Miscarriage occurred on 22Feb2021. The fetus died on 22Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021204433 same drug and reporter, different patient and event; Reported Cause(s) of Death: Fetus stopped growing on 09Feb21 (8w4d); no heartbeat detected; Mother received 1st dose of vaccine 04Feb21. Per ultrasound on 20Feb21, fetus stopped growing on 09Feb21 (8w4d); no heartbeat detected. Miscarriage occurred 22Feb21.	No prior vaccinations for this event.

MEAN CELL HAEMOGLOBIN	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.		No prior vaccinations for this event.
MEAN CELL HAEMOGLOBIN CONCENTRATION		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

(1200)

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

No prior vaccinations for this event.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

1/14/2021-0545, blood noted left and right ear. 0715, vomited x 1. Covid Antigen positive. Acute MD visit-basilar crackles right and coughing. Increased confusion.

No prior vaccinations for this event.

MEAN CELL HAEMOGLOBIN CONCENTRATION DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L

No prior vaccinations for this event.

of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

MEAN CELL HAEMOGLOBIN CONCENTRATION NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.	No prior vaccinations for this event.
MEAN CELL HAEMOGLOBIN CONCENTRATION NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021	No prior vaccinations for this event.

MEAN CELL HAEMOGLOBIN DECREASED	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without	No prior vaccinations for this event.

a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

6 days after vaccine developed bloody diarrhea. Thought to have ischemic colitis but negative evaluation. became hypotensive bradycardic placed on ventilator. Subsequently was poorly responsive and eventually coded once more and succumbed		No prior vaccinations for this event.
MECHANICAL VENTILATION		**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.		No prior vaccinations for this event.

MECHANICAL VENTILATION		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received the Moderna COVID vaccine 1/28/21. He was tested for COVID 19 on 1/29/31. Results were received 1/30/21, at which time he was evaluated and found to be hypoxic with tachycardia. He was sent to the local ER and returned this same day. On 2/2/21, he was evaluated by the provider, who sent him to the emergency room with acute respiratory distress and poor O2 sats		No prior vaccinations for this event.
MECHANICAL VENTILATION		**COVID19 (COVID19 (MODERNA)) (1201)**
On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.		No prior vaccinations for this event.

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145.	No prior vaccinations for this event.

At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

MECHANICAL VENTILATION

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
Patient was coded and expired Code Blue: Patient was in dialysis, after 30 minutes his sbp dropped to 60s he was given 4 albumin. Patient who was responsive before that became unresponsive, had seizure like activity, lost pulse and spontaneous breathing. HD stopped. Code called. Cpr started. A few minutes into cpr patient started to profusely bleed - gi bleed and ventilation became very hard., intubation was very difficult and ventilation hard as we suctioned large amounts of aspirated blood. Patient was eventually intubated. More than 8 doses of epi ws given, sodium bicarbonate * 2 given with continuous cpr. It was mostly PEA with one shockable rhythym. And shock delivered for vfib. patient continued to profusely bleed, og insertion was not successful and effective ventilation was very tough due to massive aspiration,. Possible variceal rupture with cpr from his cirrhosis is likely scenario. After 30 minutes of unsuccessful ventilation and acls protocol. Code was stopped.	No prior vaccinations for this event.
MECHANICAL VENTILATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after	No prior vaccinations for this event.

EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

MECHANICAL VENTILATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done to save his life. He subsequently passed away @ approximately 8:55 am CST on 2/11/21.	No prior vaccinations for this event.
MEDICAL INDUCTION OF COMA	**COVID19 (COVID19**

(MODERNA)) (1201)

Patient called son around 6:30am on 2/18/21. When son tried to contact patient around 8:30am, he was not able to get a hold of patient. Son sent someone over to check on patient. They found patient on the floor. He was coherent at first but then lost consciousness. It believed he experienced a stroke sometime around 8:30-9:00am of 2/18/21. Patient was taken to hospital and then transferred to another hospital. He was put in a medically induced coma. He passed between 4:00 and 4:30 pm on 02/19/21.

No prior vaccinations for this event.

MEGACOLON

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Received Pfizer Covid Vaccine in the AM on 2/9/21. Arrived to emergency department later the same day complaining of nausea, weakness, fatigue, Vomiting, Diarrhea. Post operative diagnosis, Ischemic colon/toxic megacolon.

No prior vaccinations for this event.

MEMORY IMPAIRMENT

COVID19 (COVID19 (MODERNA)) (1201)

1/13/21 pt came into clinic for vaccine. Had difficulty remembering age. Called me Mon. 1/18/21 stating she was sick. When asked what her sx were, she stated fatigue. She was well the night of the shot, Thur. and Fri. but became tired on Sat. and Sun. I went through other sx with her such as h/a, fever, n/v, muscle aches, weakness and she said she experienced none of those. I questioned her about eating and drinking and she said she ate and drank water. She seemed fine so I told her to call her doctor if she was worse or the fatigue persisted or call 911. She agreed. Two staff from clinic called her Mon. and Tues, (1/18 and 1/19). On Tues. she may have had sl slurred speech. She was found deceased on

COVID19 (COVID19

	(MODERNA)) (1201)
Patient recieved vaccine 1 of covid 19 i 1/19/2021. She felt poorly on 1/20/2021. She felt dizzy and fell at 3 AM on 1/23/2021. She felt poorly and did not know her son's name which was not normal. She went to ER on 1/24. She was assessed as not having fractures. She was going to be transferred to a skilled nursing facility. She was not having respiratory complaints. She was awaiting transfer when her O2 levels started dropping substantially. She declined aggressive intervention and she died within a few hours.	No prior vaccinations for this event.
MEMORY IMPAIRMENT	**COVID19 (COVID19 (MODERNA)) (1201)**
Per granddaughter's report, pt became very weak within hours of receiving the first dose of the Moderna COVID-19 vaccine and could not get out of bed the next morning without assistance, reported difficulty seeing, and did not recognize some family members. By Sunday, 1/31, pt was unable to be awakened, would not eat, and had low urinary output. Granddaughter reports that the morning of 2/1 he was awake and ate a small amount and seemed to be improving although still weak and unable to get out of bed. Granddaughter reported he died 2/1 around 10am in the morning.	No prior vaccinations for this event.
MENINGIOMA	**COVID19 (COVID19 (MODERNA)) (1201)**
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete	No prior vaccinations for this event.

effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021

MENTAL IMPAIRMENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient developed fever to 102 within 24 hours with decreased mentation. Stopped eating/drinking despite aggressively treating fever. Was DNR B status. Family agreed to a trial of IV fluids on 1/21 but was not successfully started until 1/22 after several attempts. Family wanted only comfort measures with no transfer to hospital. Patient continued to have fevers to 102-103 range. Patient passed on 1/23 . Patient did test positive for COVID in early September without significant illness. She was in usual state of health prior to vaccination.	No prior vaccinations for this event.

MENTAL IMPAIRMENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/23 - Mild injection site discomfort. Appetite loss compared to previous day. Beginning loss of mental acuity compared to previous day. 1/24 - Continued loss of appetite. Near complete loss of ability to move. Continued decline of mental acuity. Very little speaking. 1/25 - Stopped speaking completely. Loss of bowel control in the evening and continued until death. Complete loss of appetite. 1/26 - Near complete loss of ability to swallow. Moved to hospice 4:00pm. 1/27 - Died 4:00am	No prior vaccinations for this event.

MENTAL STATUS CHANGES	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient obtained initial dose of Moderna vaccine on Thurday, Jan 14. No adverse effects reported during initial 15 minute post vaccine waiting period. Saturday morning (Jan 16), patient developed severe cough, labored breathing, and fever. Additionally patient mental status changed suddenly, became non-	No prior vaccinations for this event.

communicative (unable to speak, but would scream if she was touched). O2 status was irregular, dropping to 78. Sunday morning, EMT and then hospice was hospice called. Monday morning, after hospice emergency kit was initiated, patient passed away.

MENTAL STATUS CHANGES

COVID19 (COVID19 (MODERNA)) (1201)

36 hours after vaccination, the patient had increased respiratory distress. He was placed on high flow nasal cannula oxygen with mild improvement. He then continued to be hypotensive requiring IV fluids and subsequently IV vasopressors. Patient's BP was stabilized with vasopresor, however he continued to deteriorate clinically with altered mental status and lethargy, concerned for bowel peroration based on physical exam by MD. He was then emergency intubated and placed on mechanical ventilation. He was then transferred to acute care hospital near by.

No prior vaccinations for this event.

MENTAL STATUS CHANGES

COVID19 (COVID19 (MODERNA)) (1201)

Extreme bouts of nausea first few days after vaccine. Estimated that patient died at home within 3-4 days after receiving the vaccine. Last phone call to daughter expressed extreme nausea and seemed to have altered mental status. Found dead by daughter on 01/04/2021.

No prior vaccinations for this event.

MENTAL STATUS CHANGES

COVID19 (COVID19 (MODERNA)) (1201)

"This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable

No prior vaccinations for this event.

troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21."

MENTAL STATUS CHANGES	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.	No prior vaccinations for this event.
MENTAL STATUS CHANGES	**COVID19 (COVID19 (MODERNA)) (1201)**
Hypoxia, Decreased responsiveness, Narrative: 86yo male with PMHx HTN, Afib not on AC after head trauma, CVA, and colon cancer who was brought to the ED by his family on 2/17. Per documentation the pt was in his usual state of health until 2/16. Received Moderna covid vaccine #2 on 2/16/21 at 0900, and was monitored for 15 minutes following immunization no noted issues. Later that night, had myalgias and took Tylenol. Per the family he slipped on the ice and fell on his butt. Overnight, had several dark stools and vomitus. was brought to the ED by his family because he was being less responsive. Pt arrived to the	No prior vaccinations for this event.

emergency department in extremis. No pulse identified. CPR immediately initiated for several rounds lasting about 25-30 minutes. ROSC unable to be achieved. Patient expired on 2/17 at 1941. Of note, per previous documentation had waxing and waning mental status at baseline. No symptoms noted with 1st dose of Moderna vaccine, which was administered on 1/16/21.

MENTAL STATUS CHANGES	**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse	No prior vaccinations for this event.

	METABOLIC FUNCTION TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Had no immediate issues with the vaccine. He had returned from the hospital on 12/21 and had some concerns about his weight which were shared with his physician on 1/4/21. On 1/5/21 had a visit with his cardiologist for a pacemaker check. On 1/8/21 staff were called to his room, he was on the floor, bluish skin color. No vital signs found, no heart rhythm heard at 2200.		No prior vaccinations for this event.

	METABOLIC FUNCTION TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who		No prior vaccinations for this event.

was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

METABOLIC FUNCTION TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer,	No prior vaccinations for this event.

however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of

No prior vaccinations for

consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from nursing home staff report.	this event.
METABOLIC FUNCTION TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home	No prior vaccinations for this event.

notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.

METABOLIC FUNCTION TEST	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support	No prior vaccinations for this event.

vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

METABOLIC FUNCTION TEST ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

No prior vaccinations for this event.

METABOLIC FUNCTION TEST ABNORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Began having SOB and cough on 2/18/21, the day after his first vaccine. Had a routine physician appointment for diabetes on 2/15/21 with no documentation of these complaints. Presented to the hospital on 2/23, soon after required intubation. Admitted with severe pneumonia, diffuse colitis, and sepsis. Condition continued to worsen until patient passed away on 2/24/21 @ 1632.	No prior vaccinations for this event.	
METABOLIC FUNCTION TEST NORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received Moderna COVID vaccine on 12/30/2020 at a Pharmacy clinic where he was a resident. Nurses at the facility reported that he was responsive and showed no signs of any adverse effects until 1/2/2021 when he was observed slightly unresponsive and staring at the ceiling and trembling. He had a fever of 101F at this time. The facility ordered labs and a rapid COVID test (all of which came back normal) and started IV antibiotics. A few hours later, patient began bleeding from his eyes, nose, and mouth and was sent to the local ER. The patient refused being admitted to the ICU for possible sepsis/hemorrhage and died the following day on 1/3/2021. All healthcare professionals involved agreed that this was not likely due to the vaccine, but needed to be reported nonetheless.	No prior vaccinations for this event.	
METABOLIC FUNCTION TEST NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1 fall after first dose on 1/8/2021 at 1930; no injuries; 4 falls after second dose on 1/14/21 at 1545, 1/15/21 at 1700, 1/21/21/at 1220 and 1/21/21 at 1330 all falls with no injuries. Started Ceftriaxone 1 GM	No prior vaccinations for

METAMYELOCYTE PERCENTAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further	No prior vaccinations for this event.

testing.

METAMYELOCYTE PERCENTAGE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild	No prior vaccinations for this event.

patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

MITRAL VALVE INCOMPETENCE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Approximately 2 weeks post vaccination developed rapid AF, CHF. Admitted to Medical Center. Discharged home on hospice. Patient died at home on 2/13/2021. Reported to this reporter at second dose clinic on 2/16/21. Other details not known. Unknown if related to vaccine.	No prior vaccinations for this event.
MITRAL VALVE INCOMPETENCE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt presented to ER with SOB on 01-29-2021. He was admitted to Healthcare with acute CHF exacerbation, elevated lactate, anemia and elevated d-dimer. Pt reports getting SOB getting up to go to the bathroom. Pt was intubated. He developed pulmonary edema. Pt expired on 02-02-2021 at 10:13 PM.	No prior vaccinations for this event.
MOANING	**COVID19 (COVID19 (MODERNA)) (1201)**
I video chatted with her Thursday after receiving the vaccine. My mom was in poor health but she was talking in complete sentences and responded appropriately. She was upright in bed and made eye contact. She smiled and denied pain. By Sunday, she was extremely weak and unable to sip water with a straw. Her health had changed dramatically and rapidly. She moaned in pain and was very fatigued. Her condition continued to deteriorate over the week and she stopped talking and was constantly sleeping. They started antibiotics for the oozing cancer lesion and then morphine for pain and end of life care. She passed away on January 22nd which was 15 days post vaccination.	No prior vaccinations for this event.
MOANING	**COVID19 (COVID19 (PFIZER-BIONTECH))**

(1200)

My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.

No prior vaccinations for this event.

MOBILITY DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient received vaccine on 1/4/2021. He was in Hospice for CHF and renal failure, but was able to get up in his wheelchair and eat and take medications and talk. On 1/5/2021 am, he was noted to be very lethargic an could only mumble, could not swallow. No localizing neurologic findings. He was too lethargic to get up in chair.

No prior vaccinations for this event.

MOBILITY DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Per granddaughter's report, pt became very weak within hours of receiving the first dose of the Moderna COVID-19 vaccine and could not get out of bed the next morning without assistance, reported difficulty seeing, and did not recognize some family members. By Sunday, 1/31, pt was unable to be awakened, would not eat, and had low urinary output. Granddaughter reports that the morning of 2/1 he was awake and ate a

No prior vaccinations for this event.

small amount and seemed to be improving although still weak and unable to get out of bed. Granddaughter reported he died 2/1 around 10am in the morning.

MOBILITY DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events	No prior vaccinations for this event.

were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA- 1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

MOBILITY DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

MOBILITY DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Resident was noted on 1/25 with an increased functional decline as she would not feed herself with utensils, but would eat finger foods if placed in her hand. She was started on Rocephin IM for possible infections. Labs had been obtained on 1/21/21, unremarkable for CBC and CMP. 75,000 colony count on urine. On 1/26/21 she was noted with right sided weakness and further decline. She was sent to Hospital for further evaluation. We were notified that she expired on 1/28/2021. Resident had been noted with a decline in function about 2 weeks earlier when she would not stand or transfer any longer. She was still responsive, taking meds, and feeding herself until 1/26/21. Further information on admitting diagnoses and progress notes from hospital have not been available to date.		No prior vaccinations for this event.
	MOBILITY DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
The vaccine was given on Monday. Tuesday afternoon he developed weakness in both legs and could not stand up. This was a new development; he had neuropathy in one leg but he had been able to stand up and walk three hours before. He was helped to the bathroom. He said he felt better and might want to stand up again. He was helped to bed. He was found dead around 5:30 Wednesday morning. He was 94 years old and had a lot of medical conditions. No one has indicated his death had anything to do with the vaccine. I'm sure it's just a coincidence that he died so soon after receiving the vaccine		No prior vaccinations for this event.
	MOBILITY DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My father was in weak condition to begin with. He didn't get out of bed for the next few days after receiving the vaccine. The little amount that he ate was consumed in bed. He began aspirating his food which lead to pneumonia. He wasn't strong enough to fight off the pneumonia even with antibiotics. He died on 1/23/21. While he might have passed soon in any case, I believe that the vaccine may possibly have increased his		No prior vaccinations for this event.

weakness/exhaustion thereby hastening his demise.

	MOBILITY DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident had slight/slow decline in health prior to vaccine but continued to be able to walk around with walker at community. The day of the vaccine she had a fever. 2 days after vaccine resident did not get out of bed all day and refused to eat. She had small amounts of orange juice as her blood sugar level was low due to not eating. Resident was diagnosed with a UTI and began an oral antibiotic. 3 days after and on day 5 after vaccine resident began feeling weak and had a fall on each day. The following day again resident spent the day in bed. The next day she was quite restless, was on the edge of her bed attempting to self transfer often throughout the day. Resident continued to be restless on the 10th of Feb, had further decline on the 11th of Feb. Resident passed away early the AM of Feb. 12th.		No prior vaccinations for this event.

	MOBILITY DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received first dose of vaccine on 1/7/21 at a community Public Health clinic. On 1/29/21 he received a second dose at the community Public Health clinic. On 2/5/21, the patient presented to the ED with complaints of shortness of breath worsening over the last 2 weeks. Patient reported that he had decreased exercise capacity and increased coughing with sputum production intermittently. Patient reported that he had been feeling chilled, but no fevers. Patient was admitted and treated with Decadron and Remdesivir. Patient experienced increased oxygen requirement. Patient was a DNI and did not want to be on life support. After discussion with the patient and family, patient was moved to comfort care. passed away on 2/11/21.		No prior vaccinations for this event.

MOBILITY DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/23 - Mild injection site discomfort. Appetite loss compared to previous day. Beginning loss of mental acuity compared to previous day. 1/24 - Continued loss of appetite. Near complete loss of ability to move. Continued decline of mental acuity. Very little speaking. 1/25 - Stopped speaking completely. Loss of bowel control in the evening and continued until death. Complete loss of appetite. 1/26 - Near complete loss of ability to swallow. Moved to hospice 4:00pm. 1/27 - Died 4:00am	No prior vaccinations for this event.
MOBILITY DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient had declining health for the past 6 months, dementia and unable to walk. Patient had decreased appetite starting 1/1/21. After 1st vaccine shot patient appetite decreased further. After 2nd vaccine shot patient fatigue increased to the point where she could not get out of bed and had minimal appetite. Patient passed away 10 days after receiving 2nd shot on 2/22/21. Patient did not go to ED and was not hospitalized.	No prior vaccinations for this event.
MOBILITY DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
92 year-old male with PMHx of vascular dementia, BPH, MDD, sleep disturbance , basal cell carcinoma of neck, osteoarthritis, BLE edema, Guillain-Barre syndrome 30 years prior, s/p COVID positive on 1/11/21 and received IV Bamlanivimab. Sent to hospital on 2/2/21 for altered mental status, generalized weakness with inability to lift bilateral UE and difficulty moving his BLE. He was treated for UTI with 7 days of Cefepime for Morganella Morganii. He was followed by neurology with MRI of the brain and CT of the spine	Influenza Vaccine

without acute findings. Lumbar puncture unable to be obtained. He received 5 day course of IVIG for presumed Guillain-Barre . EMG showed generalized sensory motor polyneuropathy both axon loss and demyelinating type severe in degree. However, he did not recover from his GBS symptoms, was transferred back to the nursing home and died on 2/15/2021.

	MONOCYTE COUNT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.		No prior vaccinations for this event.
	MONOCYTE COUNT DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.		No prior vaccinations for this event.
	MONOCYTE COUNT DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs		No prior vaccinations

(see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day for this event. labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a

transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

MONOCYTE COUNT INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021

No prior vaccinations for this event.

MONOCYTE COUNT NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile

No prior vaccinations for this event.

stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

	MONOCYTE PERCENTAGE DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."		No prior vaccinations for this event.

MOUTH HAEMORRHAGE

COVID19 (COVID19 (MODERNA)) (1201)

Resident became lethargic and reports of blood coming from resident's nose and mouth on the morning of 1/13/21. Resident went out to ER for eval, and came back to facility with dx of pneumonia and recommendations for resident to be placed on hospice. Resident deceased on 1/14/21. Unknown if vaccine related, but with timeline of events I was advised to report this per medical director of facility, as well as Pharmacy who administered the vaccine.

No prior vaccinations for this event.

MOUTH HAEMORRHAGE

COVID19 (COVID19 (MODERNA)) (1201)

Patient received Moderna COVID vaccine on 12/30/2020 at a Pharmacy clinic where he was a resident. Nurses at the facility reported that he was responsive and showed no signs of any adverse effects until 1/2/2021 when he was observed slightly unresponsive and staring at the ceiling and trembling. He had a fever of 101F at this time. The facility ordered labs and a rapid COVID test (all of which came back normal) and started IV antibiotics. A few hours later, patient began bleeding from his eyes, nose, and mouth and was sent to the local ER. The patient refused being admitted to the ICU for possible sepsis/hemorrhage and died the following day on 1/3/2021. All healthcare professionals involved agreed that this was not likely due to the vaccine, but needed to be reported nonetheless.	No prior vaccinations for this event.
MOUTH ULCERATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/12/2021 Vaccine 2/13/2021 Weakness, oral ulcers 2/17/2021 Brought to ER for loss of consciousness, altered mental status, rectal bleeding; work up showed sepsis, UTI, anemia, pneumonia, pleural effusion, pancytopenia, hypotension; persistent hypotension and respiratory failure 2/18/2021 Passed away at 5:54AM	No prior vaccinations for this event.
MOVEMENT DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
On 1/17/2021 patient woke and began her day as usual, was found down by family member 1 hour later conscious but unable to speak and unable to move her R side. She was admitted to the hospital - Initial NIHSS was 26 and CT imaging showed no acute hemorrhage but mild hypodensity of greater than 1/3 of the MCA territory (TPA not recommended). CTA did show distal L M1/M2 occulsion and she was transferred to larger facility for thrombectomy. Unfortunately the patient had persistent severe neurological deficits after thrombectomy. Was discharged home on hospice care and expired on 1/23/21.	No prior vaccinations for this event.
MOVEMENT DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH))**

(1200)

PATIENT GOT HER FIRST COVID PFIZER VACCINE AT 12/31 IN THE AM. HAD GOTTEN FLU LIKE SYMPTOMS AND HAD BEEN SICK FOR A COUPLE OF DAYS. HAD NAUSEA AND VOMITTING DURING THIS TIME AS WELL. ON 1/3 THE CARE GIVER WENT TO CHECK ON HER PT AT HER LTC FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.

No prior vaccinations for this event.

MOVEMENT DISORDER

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

92 year-old male with PMHx of vascular dementia, BPH, MDD, sleep disturbance , basal cell carcinoma of neck, osteoarthritis, BLE edema, Guillain-Barre syndrome 30 years prior, s/p COVID positive on 1/11/21 and received IV Bamlanivimab. Sent to hospital on 2/2/21 for altered mental status, generalized weakness with inability to lift bilateral UE and difficulty moving his BLE. He was treated for UTI with 7 days of Cefepime for Morganella Morganii. He was followed by neurology with MRI of the brain and CT of the spine without acute findings. Lumbar puncture unable to be obtained. He received 5 day course of IVIG for presumed Guillain-Barre . EMG showed generalized sensory motor polyneuropathy both axon loss and demyelinating type severe in degree. However, he did not recover from his GBS symptoms, was transferred back to the nursing home and died on 2/15/2021.

Influenza Vaccine

MULTIMORBIDITY

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

No documented vaccine reaction Hospitalized due to co-morbities No prior vaccinations for this event.

MULTIPLE ORGAN DYSFUNCTION SYNDROME **COVID19 (COVID19 (MODERNA)) (1201)**

Patient had Covid-19 in October of 2020. He recovered. He received the vaccination on 12/30/2020 with no complaints. On 01-05-2021 it was noted to he was incontinent of urine and bilateral lower extremity edema. Lab work was completed showed acute kidney injury. He had decreased blood pressure and oxygen saturations on 01-06-2021 He was admitted to the hospital with rapid progression of symptoms and suggested multi-system failure. He had a long cardiac history. On 01-14-2021 he passed away with a diagnosis of Cardiomyopathic CHF, A.Fib contributory.

No prior vaccinations for this event.

MULTIPLE ORGAN DYSFUNCTION SYNDROME **COVID19 (COVID19 (MODERNA)) (1201)**

jaundice->hemolytic anemia-> hemorrhagic shock->multi organ failure->death pt admitted to ICU 2/16 with Hgb=3.4, treated with steroids, supportive care , pressors, pt died 2/20/21

MULTIPLE ORGAN DYSFUNCTION SYNDROME **COVID19 (COVID19 (MODERNA)) (1201)**

High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased; Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of

No prior vaccinations for this event.

breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death		
MULTIPLE ORGAN DYSFUNCTION SYNDROME		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient stated he wasn't feeling well on January 25, 2021, wasn't eating and complained of abdominal pain. Patient noted to have indigestion and was constipated. Meds provided and labs ordered. On morning of January 26, 2021, patient became weak, lethargic and hypoxic and was sent to emergency department around 0700 hours on January 26, 2021. At approximately 1100 hours, emergency physician notified this writer that patient was not going to overcome his illness and would be placed on comfort care. At approximately 1130 hours, this writer was notified that patient had passed away from multi-organ failure.	No prior vaccinations for this event.	
MULTIPLE ORGAN DYSFUNCTION SYNDROME		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Legs started swelling and shortness of breath Thursday January 21 2021 Was rushed to hospital with kidney failure and fluid build up around lungs and entire body Blood pressure dropped and had multiple organ failure	No prior vaccinations for this event.	

MULTIPLE ORGAN DYSFUNCTION SYNDROME

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

She started having breathing problems/heart attack appearance. on 1/22/21 and went to the ER. Upon admittance was told it was an anaphylactic shock from the Covid shot. They kept her in ICU and released her 1/23/21. At 12:45 am on 1/24/21 she passed out and we called the ambulance. Hospital admitted her and worked through multiple organ failure issues and thought her numbers were under control. She was released on 1/27/21 and was driving on 1/28/21 around 4:15 pm and appears to have had heart failure and had a wreck. She passed away that day.

No prior vaccinations for this event.

MUSCLE RIGIDITY

COVID19 (COVID19 (MODERNA)) (1201)

ON 1/14/2021 TYPICAL UTI SYMPTOMS FOR RESIDENT DEVELOPED INCLUDING FEVER AND RIGIDITY. RESIDENT IS NON-VERBAL. IV ANTIBIOTICS WERE STARTED. FREQUENT UTI'S ARE COMMON FOR THIS RESIDENT.

No prior vaccinations for this event.

MUSCLE RIGIDITY

COVID19 (COVID19 (MODERNA)) (1201)

Death Narrative: Patient received Covid vaccine on 2/2/21, person reports his legs were more rigid with some sweating the day of the vaccination with leg rigidity that was slowly improving. No other adverse effects reported for following 7 days. Person states he had vomiting episode earlier this week, person states he had no other symptoms before or after the vomiting episodes. On morning of 2/12/21, person reports patient got up ready for breakfast with no issues. She says he asked for chorizo and oatmeal but she laughed and said don't you mean chorizo and eggs. He said yes. They got him into W/C and he was rolling himself into dining room got stuck in hallway. She says he took several breaths then 3 very deep breaths and passed away. She called 911 they took his VS but he has passed. She told them to leave him

along no resuscitation.

	MUSCLE RIGIDITY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt	No prior vaccinations for this event.

well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

MUSCLE SPASMS

COVID19 (COVID19 (MODERNA)) (1201)

Do not know if patient informed her physician that she received vaccine on 1/29/2021. She had appt at 3:15 pm on 1/29 and afterwards stated she received the Moderna vaccine. Reporter is uncertain if this was at a health office or clinic. She drove herself to the ER at about 3am on 1/30/2021 with increased cramping and pain.

No prior vaccinations for this event.

MUSCLE SPASMS

COVID19 (COVID19 (PFIZER-BIONTECH))

		(1200)
"Pt had 2nd vaccine, went home and started having ""cramping"" in all of her muscles. It became bad enough that she was taken to local ED where she then started coughing up blood, required intubation and about 6 hrs later, died."	No prior vaccinations for this event.	
MUSCLE TWITCHING		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Approximately 10 minutes after receiving the COVID- 19 vaccine resident displayed seizure activity, staring straight ahead and strong allover muscle jerking of both the up and lower extremities, color became gray, activity lasted approximately 3 minutes, resident then became relaxed, color returned to normal, BP-140/80, 97.8, 60, 16, sleeping the remainder of the shift,. Resident continued to decline until resident CTB on 1/19/21	No prior vaccinations for this event.

"death. Per son pt was not feeling well after the vaccination ""like her legs were weak."" Son found the mom in her bed 1am on 2/12/2021 unresponsive."	No prior vaccinations for this event.	
MUSCULAR WEAKNESS		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient described feeling nervous, anxious the next morning (Wednesday) after the vaccine. He later fell in the bathroom after using the restroom, his legs gave out (his words) and consequently was on the ground for 23 hours before being transported to the hospital. That was Thursday afternoon. He was diagnosed with COVID-19 on Saturday night and died the following Friday morning.	No prior vaccinations for this event.	

	MUSCULAR WEAKNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
increase weakness and fatigue, weakness in extremities, incontinent, jerky arm movements, within first 24 hours, continue to decline sent to hospital returned weaker, within 24 hrs hours BP dropped, low pulse oximeter reading, diaphoretic, lung sounds diminished, loss consciousness and passed away. 01-12-2021		No prior vaccinations for this event.
	MUSCULAR WEAKNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
The vaccine was given on Monday. Tuesday afternoon he developed weakness in both legs and could not stand up. This was a new development; he had neuropathy in one leg but he had been able to stand up and walk three hours before. He was helped to the bathroom. He said he felt better and might want to stand up again. He was helped to bed. He was found dead around 5:30 Wednesday morning. He was 94 years old and had a lot of medical conditions. No one has indicated his death had anything to do with the vaccine. I'm sure it's just a coincidence that he died so soon after receiving the vaccine		No prior vaccinations for this event.
	MUSCULAR WEAKNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
[COVID-19 Vaccine] treatment under Emergency Use Authorization(EUA): He presented 10 days after first COVID-19 Vaccine with Progressive neurological deficits with bulbar manifestations - dysarthria, dysphagia and bilateral arm weakness and incoordiantion, worse on right. MRI brain was negative for acute stroke and MRI cervical, showed degenerative changes. Transferred from community hospital to tertiary center where the diagnosis was made of AIDP. He was intubated at that time in Neuro ICU. Given Steroids and IVIG but no improvement and was either will need to have Trach and PEG vs CMP and family honored the patient's		No prior vaccinations for this event.

wishes and made him CMO. signs of severe demyelination and AIDP was diagnosed.

MUSCULOSKELETAL DISCOMFORT	COVID19 (COVID19 (MODERNA)) (1201)
Individual developed severe body aches, severe shoulder discomfort, high fevers (documented max temp. 103.7 F). Daughter reported that she became non-responsive with high fevers, and when the fevers decreased she was more lucid. Her condition rapidly progressed to nausea vomiting, diarrhea and patient died on 2/9/2021.	No prior vaccinations for this event.

MUSCULOSKELETAL STIFFNESS	COVID19 (COVID19 (MODERNA)) (1201)
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen	No prior vaccinations for this event.

levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

MUSCULOSKELETAL STIFFNESS	**COVID19 (COVID19 (MODERNA)) (1201)**
My grandpa got his second covid vaccine on Thursday. Saturday he complained of stiff neck. Sunday he had low grade fever, nausea and vomiting, chills, and mild headache. He was feeling bad enough to call squad at 3 pm. The paramedics did evaluation and thought he was just experiencing normal side effects from vaccine and felt no need to transport to hospital so my grandpa decided to stay home and just rest. At 2 am that same night he went into cardiac arrest and was not able to be brought back	No prior vaccinations for this event.
MUSCULOSKELETAL STIFFNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
This is a 94-year-old male who is brought in by ambulance after being found on the floor with unknown downtime. He was in asystole upon EMS arrival. He remains in asystole. No advanced airway is in place. The patient is getting compressions from Lucas device upon arrival. It was reported that he was last talked	No prior vaccinations for this event.

to by family at 2 PM. The patient got his SARS-CoV-2 vaccination this morning. The patient is evaluated emergently. CPR was ongoing with 3 rounds of epinephrine given. The patient remains in asystole. He has rigor mortis. The patient's pupils are fixed and dilated. The patient has compressions paused and ultrasound is used to evaluate for cardiac activity. None is detected. The patient has no electrical activity on monitor. The patient's time of death is 2113.

MUSCULOSKELETAL STIFFNESS	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

	MYALGIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Cardiac arrest; Pain on her upper right chest; Lot of pain in lower abdomen; Pain underneath arm; Thought it was muscle aches; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed upper right chest pain and underneath the arm, severe abdominal pain, muscle aches and cardiac arrest. The patient's medical history was not provided Concomitant product use was not provided by the reporter. On 14 Jan 2021, approximately five days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the arm for prophylaxis of COVID-19 infection. On 19 Jan 2021, the patient developed upper right chest pain and pain underneath the arm. They thought it was muscle aches. Sometime later, the patient developed a lot of pain in the lower abdomen. The called emergency services and an ambulance arrived but the patient then suffered cardiac arrest. Treatment for the event included tramadol. Action taken with mRNA-1273 in response to the events was not applicable due to the patient was died. The patient died on 19 Jan 2021. The cause of death was reported as cardiac arrest. Autopsy were not provided.; Reporter's Comments: Company Comment: This case concerns a 92-year-old female patient who experienced unexpected serious events of cardiac arrest, upper right chest pain and underneath the arm, severe abdominal pain, muscle aches. The event occurred 5 days after the administration of the first dose of the vaccine mRNA-1273 vaccine (Lot #: unknown, expiration date-unknown). Although a temporal association exist between the events and the administration of the vaccine, in the absence of critical details such as the patient's medical history, any diagnostic test or autopsy result, adequate evaluation and assessment cannot be established. Main field defaults to æpossibly related' for all events.; Reported Cause(s) of Death: Cardiac arrest		No prior vaccinations for this event.

well; Achiness; Severe fever; Chills; A spontaneous report was received from a physician concerning a 56-year-old female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed fever, chills, achiness, shortness of breath, gurgling and unresponsive. The patient's medical history was not provided. Concomitant product use was not provided. On 19 Jan 2021, prior to the onset of the events, the patient received their second of two planned doses of mRNA-1273 (Lot 042L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. After receiving the vaccine on 19 Jan 2021, the patient experienced fever, chills, shortness of breath, gurgling and achiness. On 21 Jan 2021, the patient was found unresponsive. Emergency medical services were called to perform life saving measures however, they were unsuccessful. No further treatment information was provided. The patient died on 21 Jan 2021. The cause of death was reported as unknown. An autopsy was planned.; Reporter's Comments: This case concerns a 56-year-old, female, who experienced a serious event of death, with many other events after receiving second dose of mRNA-1273 (Lot# 042L20A). Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

for this event.

MYALGIA

COVID19 (COVID19 (MODERNA)) (1201)

Pt died on 2/15/21. On 2/13/21, pt complained of muscle aches. No prior vaccinations for this event.

MYALGIA **COVID19 (COVID19 (MODERNA)) (1201)**

Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right

No prior vaccinations for this event.

arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia

Pt received vaccine on 7 jan. 2021 Twelve days later, on 19 January 2021, Pt developed symptoms of COVID (cough, sore throat, fever, myalgias), on 20 Jan, pt admitted to hospital for worsening symptoms. Pt tested positive for COVID 19. Pt admitted to ICU where pt had complicated hospital course to include ARDS secondary to COVID pneumonia, nonSTEMI, with biventricular heart failure, on multiple pressor, rhabdomyolysis with acute kidney injury, requiring CRRT. Pt was in hospital for 10 days; he passed away on 31 Jan 2021.	No prior vaccinations for this event.

	MYALGIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Patient complained of soreness in muscles morning after receiving the shot. She went about her day had a smoothie, spoke to people and also went for a walk came home and went into her jacuzzi tub and consequently passed away while in the tub. She was found by her husband at around 545pm, time of death	No prior vaccinations for this event.

is unknown and cause of death is currently pending.

	MYALGIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
	Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her	No prior vaccinations for this event.

husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool

Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

MYELOCYTE PERCENTAGE

COVID19 (COVID19 (PFIZER-BIONTECH))

(1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

MYELODYSPLASTIC SYNDROME

COVID19 (COVID19 (MODERNA)) (1201)

High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased; Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills,

No prior vaccinations for this event.

fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

	MYOCARDIAL INFARCTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient had swelling around her jaw after her second shot of the covid , Pfizer vaccine (.5 ml IM) on the Friday morning, January 29th, I took her to a follow up appointment with the cardiologist at 3:00 pm, as a follow up to a small heart attack event with hospitalization two weeks previously, at the cardiologist she was		No prior vaccinations for this event.

given the ok/all is well. That next morning early, she had a 911 event at her assisted living apartment and was sent back to the hospital, having had another heart attack. Patient died on the following Thursday, February 4, 2021. I do not know if the vaccination had any cause for my mothers death; but I feel it is necessary to report this series of heart attacks after she received the pfizer vaccine. Her Certificate of Death records the cause of death as ""Coronary Artery Disease""."

MYOCARDIAL INFARCTION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Patient died 3 days after receiving his first dose of the Covid vaccine. He saw his doctor 2 weeks prior to his death with absolutely no complaints, very healthy. He had no prior heart conditions and was pronounced dead of a heart attack.	No prior vaccinations for this event.

MYOCARDIAL INFARCTION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Cardiac Event MI or Stroke; Cardiac Event MI or Stroke; This is a spontaneous report from a contactable consumer (Son in law). A 73-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at left arm on 17Feb2021 14:00 at single dose for covid-19 immunisation. Medical history included atrial fibrillation (AFib), prostate cancer Survivor. Concomitant medication included alirocumab (PRALUENT), escitalopram oxalate (LEXAPRO), apixaban (ELIQUIS), nitroglycerin and Ca channel blocker. The patient received the first dose of BNT162B2 on an unknown date for covid-19 immunisation. The patient experienced cardiac event myocardial infarction (MI) or stroke on 17Feb2021. Adverse event result in Doctor or other healthcare professional office/clinic visit. It was unknown if treatment received for the events. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for	No prior vaccinations for this event.

COVID-19. The patient died on 19Feb2021. It was unknown if an autopsy was performed. The outcome of the events was fatal. The reporter didn't know if this was associated or not. Information on the lot/batch number has been requested.; Reported Cause(s) of Death: Cardiac Event MI or Stroke; Cardiac Event MI or Stroke

heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on 17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with	No prior vaccinations for this event.

outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

MYOCARDIAL ISCHAEMIA

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Pt develops left leg pain The day after vaccination in AM subsequently drove approximately 150 miles On his way back stopped at his brothers place for lunch. He then collapsed coning down the steps, EMS started CPR. took him to ER Resuscitated briefly but went into CardioPulm Arrest again and PEA Resucitaion for aprox 1 hour but was unsuccessful. Noted to have Left leg more swollen than Right by 3 to 4 CM presumed to have died from massive Pulmonary embolism and inferior wall myocardial ischemia

No prior vaccinations for this event.

MYOCARDIAL ISCHAEMIA

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in

No prior vaccinations for this event.

the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition:

"Pt son, reports patient passed away on 2/1/21 in the early hours. Pt wife, told Pt's son that patient started feeling ""bad"" with common cold like symptoms on 1/31/21, had a temp of 99.0. Pt's wife went to take a shower, when she got out patient was unresponsive. She called EMS, they pronounced patient deceased upon arrival. á Pt's son also reports patient and Pt's wife both had their 1st COVID-19 vaccine 13 days prior. He was told by EMT on sight to notify the facility where they received their vaccines. He did contact them and was told to notify PCP."	No prior vaccinations for this event.
NASOPHARYNGITIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19	No prior vaccinations for this event.

immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The

patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second

COVID-19 Vaccine.; Reported Cause(s) of Death: Death

NASOPHARYNGITIS	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on 17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting	No prior vaccinations for this event.

to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

Patient had the first Moderna Covid vaccine on Thursday 1/21/2021. She had a bit of sore arm on that day and the day after. On Saturday 1/23/2021, she had a fever of 100.5 F (11AM), nausea, light headache and chills. The temperature went down after she took ibuprofen. Patient's husband enrolled her to V-Safe to report all the adverse effects she experienced. On Sunday 1/24/2021, her temperature was 98.3F. She still had nausea and no appetite. She and her husband watched a football game in their bedroom upstairs. Husband noticed that his wife was pacing around the room many times. At 7Pm, Husband went downstairs for dinner but she refused to come down to eat. He went upstairs around 8pm, TV was still on. He turned off TV and went down stairs again thinking his wife felt as sleep while watching TV. He went back upstairs for bed around 10:30 PM. Husband said his wife had a deviated septum so she would snore very loudly when asleep. He didn?t hear her snoring so he went to check on her and found her not responsive. Husband called emergency services. Paramedic came at 10:45 and said patient was passed. Husband sent many texts to V-safe after that to report the incident. No response was received from V-safe. Patient?s doctor told her husband that she died due to cardiac arrest.		No prior vaccinations for this event.

She had pain in the injection site Tuesday night and then during Tuesday she got worse with nausea and some fever. By Wednesday she was complaining that she could not pee even though she was drinking a lot of fluids. She continued to complain it was the worst she ever felt and then at 0600 Thursday morning she woke us up and said she needed to go to the hospital. We arrived at the hospital just before 0700 and she immediately threw up in the trash can. We went into a treatment room and they took blood and started fluids as she became incoherent. She said she had taken Tylenol so they started a drug to counter that but her liver function was all wrong and they started to look for a hospital that could transplant a liver. She was air evade about 0930 to Medical center and just over 30 hours latter she was dead. There is a pending autopsy. She was a healthy 39 year old mother who got the shots because she worked as a surgical tech and she was the

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.		No prior vaccinations for this event.

Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021.

this event.

Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was

unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

	NAUSEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was found with no pulse no heart rate by a staff member around 11 pm. Earlier that day seen by myself for fatigue, sorethroat, nausea.		No prior vaccinations for this event.

	NAUSEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
patient was not vaccinated at hospital. Caregiver reports that patient was vaccinated with second dose on Monday 2/15/21. Tuesday patient experienced n/v/d. Went to an ED on Wednesday and was cleared and sent home. Thursday reported shortness of breath to her caregiver and then collapsed. Patient was brought to as PEA arrest and ultimately died.		No prior vaccinations for this event.

	NAUSEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose		No prior vaccinations for this event.

of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol

sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

blood clot; death cause: Heart Problems; tired; nauseous; This is a spontaneous report from a contactable consumer. An 81-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot number EL3248), via an unspecified route of administration at single dose in the left arm on 19Jan2021 14:00 for covid-19 immunisation. Medical history included heart problems, pacemaker. Concomitant medication included heparin. The patient experienced death cause: heart problems on 20Jan2021, blood clot on an unspecified date with outcome of unknown that required hospitalization, tired on 19Jan2021 with outcome of unknown, nauseous on 19Jan2021 with outcome of unknown. The patient was hospitalized for blood clot from 16Jan2021 to 18Jan2021. The patient died on 20Jan2021. An autopsy was not performed. The events were described as follows: The patient was tired and nauseous about 3 hours after her vaccine. She had been in the hospital 16Jan2021 to 18Jan2021 for a blood clot. The patient died at her home on 20Jan2021 between 4 and 7 pm. No treatment required. The vaccine was administered at Hospital Facility. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient had not been tested for COVID-19.; Reported Cause(s) of Death: death cause: Heart	No prior vaccinations for this event.

Problems

NAUSEA	**COVID19 (COVID19 (UNKNOWN)) (1202)**
Received first SARS-CoV2 vaccination yesterday at local store Experienced new symptoms of chills, nausea as well as worsening from baseline dyspnea at night. Wife states he had rough morning breathing and had sudden loss of consciousness and unresponsiveness and failed to respond to bystander CPR. He expired at his home.	No prior vaccinations for this event.
NECK PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
"On 1/15/2021 at 1800, resident noted to be lethargic and shaking, stating ""I don't care."" repeatedly. C/O head and neck pain. T100.6. Given Tylenol with no relief of pain. Order received for Aleve and administered.. Assisted to bed as usual in evening. Monitored during night shift and noted to be resting comfortably/sleeping.. Noted agonal breathing at 4:10 AM 1/16/2021 , T 99.4, Absence of vital signs at 4:15AM 1/16/21 and death pronounced at 4:40AM 1/16/21."	No prior vaccinations for this event.
NECK PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
1/24/21 0445- patient presents to the ED with complaints of neck pain, chest pain, and back pain for about a week. States also feels SOB, intermittent fever with temperature 100.3 on arrival. Patient was worked up for his cardiac type symptoms, found to have elevated WBC and CRP with no explanation. D-Dimer was elevated with CT showing no sign of PE. Patient was sent home from the ED with instructions to follow up with primary care and/or return if s/s worsen. 1/24/21 1705- patient is returned to the ED via ambulance after becoming unresponsive and some seizure like activity. Patient was intubated. Head CT showed large brain bleed that was irreparable and not compatible with life. Patient was also found with positive blood	No prior vaccinations for this event.

cultures x2 with gram positive cocci in clusters growing after 9 hours.

NECK PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Jan 3 vaccine administered, jan 4 started headaches, vomiting, pain in the back of the neck, Headaches, chills, loss of speech,	No prior vaccinations for this event.

NECK PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Same day as vaccination given, developed pain went from arm up to shoulder, to back, to neck to head - right side of body; chills/body aches	No prior vaccinations for this event.

NERVOUS SYSTEM DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
On 1/17/2021 patient woke and began her day as usual, was found down by family member 1 hour later conscious but unable to speak and unable to move her R side. She was admitted to the hospital - Initial NIHSS was 26 and CT imaging showed no acute hemorrhage but mild hypodensity of greater than 1/3 of the MCA territory (TPA not recommended). CTA did show distal L M1/M2 occulsion and she was transferred to larger facility for thrombectomy. Unfortunately the patient had persistent severe neurological deficits after thrombectomy. Was discharged home on hospice care and expired on 1/23/21.	No prior vaccinations for this event.

NERVOUS SYSTEM DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

[COVID-19 Vaccine] treatment under Emergency Use Authorization(EUA): He presented 10 days after first COVID-19 Vaccine with Progressive neurological deficits with bulbar manifestations - dysarthria, dysphagia and bilateral arm weakness and incoordiantion, worse on right. MRI brain was negative for acute stroke and MRI cervical, showed degenerative changes. Transferred from community hospital to tertiary center where the diagnosis was made of AIDP. He was intubated at that time in Neuro ICU. Given Steroids and IVIG but no improvement and was either will need to have Trach and PEG vs CMP and family honored the patient's wishes and made him CMO. signs of severe demyelination and AIDP was diagnosed.	No prior vaccinations for this event.	
NERVOUSNESS		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient described feeling nervous, anxious the next morning (Wednesday) after the vaccine. He later fell in the bathroom after using the restroom, his legs gave out (his words) and consequently was on the ground for 23 hours before being transported to the hospital. That was Thursday afternoon. He was diagnosed with COVID-19 on Saturday night and died the following Friday morning.	No prior vaccinations for this event.	
NEURALGIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On 1/29/21 patient began not feeling well and saw her provider. The doctor gave her fluids and tramadol for pain. They noticed increased confusion, but thought that could have been due to the tramadol. They also increased her gabapentin as she was experiencing nerve pain. Patient also developed a rash and was diagnosed with shingles on 2/1/21. Patient died on 2/3/21	No prior vaccinations for this event.	
NEUROLOGICAL SYMPTOM		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Vomit 30 minutes after administration. approx. 9 hours later, resident has Stroke-like symptoms. He was previously on Hospice before admitting to our facility and planned to be readmitted to hospice upon discharge.	No prior vaccinations for this event.
NEUROLOGICAL SYMPTOM	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient woke up on the morning of 2/6 with symptoms of a stroke. Rushed to hospital where clot found in brain. Recovered from initial stroke but then had another major stroke on 2/8 and never recovered.	No prior vaccinations for this event.
NEUTROPHIL COUNT	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.	No prior vaccinations for this event.
NEUTROPHIL COUNT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central	No prior vaccinations for this event.

line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral

central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

	NEUTROPHIL COUNT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.		No prior vaccinations for this event.
	NEUTROPHIL COUNT DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73,		No prior vaccinations for this event.

2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

NEUTROPHIL COUNT INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

"02/08/21--2 days after vaccine--Resident stated that she ""didn't feel good"" (She is developmentally delayed and less able to communicate how she feels than those in the community) and stopped eating most foods; also had fatigue. Vitals, coloring, & behavior were normal. 02/09/21--Belly was firm and mildly distended (although she stated it didn't hurt); she coded this evening and CPR was performed before EMT could transport her to the hospital. 02/10/21--Resident passed."

No prior vaccinations for this event.

NEUTROPHIL COUNT INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1

No prior vaccinations for this event.

cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021

NEUTROPHIL COUNT NORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.

No prior vaccinations for this event.

NEUTROPHIL COUNT NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

No prior vaccinations for this event.

NEUTROPHIL COUNT NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of

No prior vaccinations for

chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	this event.

	NEUTROPHIL PERCENTAGE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.		No prior vaccinations for this event.
	NEUTROPHIL PERCENTAGE	**COVID19 (COVID19 (MODERNA)) (1201)**
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021		No prior vaccinations for this event.
	NEUTROPHIL PERCENTAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient		No prior vaccinations for this event.

passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.

NEUTROPHIL PERCENTAGE DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.	No prior vaccinations for this event.

NIH STROKE SCALE SCORE INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
On 1/17/2021 patient woke and began her day as usual, was found down by family member 1 hour later conscious but unable to speak and unable to move her R side. She was admitted to the hospital - Initial NIHSS was 26 and CT imaging showed no acute hemorrhage but mild hypodensity of greater than 1/3 of	No prior vaccinations for this event.

the MCA territory (TPA not recommended). CTA did show distal L M1/M2 occulsion and she was transferred to larger facility for thrombectomy. Unfortunately the patient had persistent severe neurological deficits after thrombectomy. Was discharged home on hospice care and expired on 1/23/21.

NITRITE URINE ABSENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21	No prior vaccinations for this event.

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious,	No prior vaccinations for this event.

but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

OESOPHAGOGASTRODUODENOSCOPY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.	No prior vaccinations for this event.

ORAL MUCOSAL BLISTERING

COVID19 (COVID19 (PFIZER-BIONTECH))

(1200)

"The day after the 2nd shot, patient developed blisters on his lips and mouth. The care facility said that he had a nut allergy -- but he had never been allergic to nuts. He stopped eating and drinking and his BP had dropped to 60/40. By Jan 16th they called to say he was dying and he passed away on 1/18/21. Patient had COVID19 from Oct 29th - early November. By Nov 21st he had lost 40 lbs. He was 6'3"" and had gone from 189lbs to 149 lbs with COVID. By Nov 21st when we could visit, he had recovered from COVID, but was very thin and weak. He could not bathroom alone and kept falling. He didn't seem to have a bad reaction to the 1st COVID shot, But he immediately reacted to the 2nd shot and passed away within 6 days."

Shingles - Glaxo 8/22/2020, resulted in hospitalization and LTC.

ORAL PAIN

COVID19 (COVID19 (MODERNA)) (1201)

ON 02/08/2021 AROUND 0600 RESIDENTCOMPLAINED OF MOUTH PAIN AND RECEIVED OXYCODONE. DURING THE COURSE OF THE MORNING, RESIDENT EXHIBITED A FEW EPISODES OF LABORED/SHALLOW BREATHING AND SOB AT RESTING. 0XYGEN SATURATION RATE WAS 93-98% ON ROOM AIR, LUNG SOUNDS CLEAR IN ALL LOBES AND PULSE AND TEMPERATURE WITHIN NORMAL RANGE. AS THE DAY PROGRESSED, VITAL SIGNS REMAINED STABLE BUT RESIDENT CONTINUED TO HAVE PERIODS OF SOB/LABORED BREATHING.FAMILY AND NURSE PRACTIONER UPDATED AND THE ORDER WAS RECEIVED TO SEND PATIENT TO MEDICAL CENTER ER FOR EVALUATION PER AMBULANCE. RESIDENT TRANSPORTED AT 1425. RESIDENT RETURNED FROM THE ER AT 1830 ON HOSPICE CARE WITH THE DIAGNOSIS OF: ACURE RESPIRATORY FAILURE WITH HYPOXIA AND END OF LIFE DECISION MAKING. RESIDENT WAS MADE COMFORTABLE AND MONITORED DURING THE NIGHT AND EXPIRED AT 0630 ON 02/09/2021.

No prior vaccinations for this event.

OROPHARYNGEAL DISCOMFORT

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
The day following the vaccine, the patient complained of throat issues and anxiety. This was not new... however . That evening he reported difficulty breathing and was placed on oxygen; a COVID test was performed and was negative. On 12/30/2020, patient complained of sternal pressure and was transferred to the hospital. The patient died 12/31/2020 and records obtained from the hospital indicated the patient died from a massive myocardial infarction.	No prior vaccinations for this event.
OROPHARYNGEAL PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.	No prior vaccinations for this event.
OROPHARYNGEAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt received vaccine on 7 jan. 2021 Twelve days later, on 19 January 2021, Pt developed symptoms of COVID (cough, sore throat, fever, myalgias), on 20 Jan, pt admitted to hospital for worsening symptoms. Pt tested positive for COVID 19. Pt admitted to ICU where pt had complicated hospital course to include ARDS secondary to COVID pneumonia, nonSTEMI, with biventricular heart failure, on multiple pressor, rhabdomyolysis with acute kidney injury, requiring CRRT. Pt was in hospital for 10 days; he passed away on 31 Jan 2021.	No prior vaccinations for this event.

	OROPHARYNGEAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/15: Pfizer vaccine dose 1 administered 1/16: Fever, chills 1/22: Sore throat, coughing w/white phlegm, taking Tylenol and Mucinex. Fever and chills from 1/16 subsided. Had telehealth consultation with PA. Per her notes, patient said he gets these symptoms annually, requested for an antibiotic. PA referred him for a COVID test. Ordered hydrocodone/chlorphen ER suspension for his cough and an antibiotic. Antibiotic was recommended if symptoms do not subside. 1/23: COVID test administered 1/25: Reported positive for COVID 1/26: Telehealth session w/PA: she informed patient of his positive test, advised to quarantine and seek medical help at hospital if symptoms worsen. Patient reported that his sore throat mostly subsided but is still coughing at night. Said that the pharmacy didn't receive the prescription order for the antibiotic, so this was re-ordered. 1/31: Partner found him dead at 8:18AM on his bed. Death certificate issued by state says cause of death: COVID. Autopsy was not performed. Buried on 2/9/21.		No prior vaccinations for this event.

	OROPHARYNGEAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was found with no pulse no heart rate by a staff member around 11 pm. Earlier that day seen by myself for fatigue, sorethroat, nausea.		No prior vaccinations for this event.

	OROPHARYNGEAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
A few days after the vaccination my father had a sore throat and slight cough. This progressed into pneumonia like symptoms and he died on 2/11/21.		No prior vaccinations for this event.

ORTHOPNOEA	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off	No prior vaccinations for this event.

to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

OVARIAN CANCER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Day after receiving the vaccine, the patient complained of abdominal pain which worsened over the day. She went to the ED and was hospitalized. Abdominal pain complaints increased and continued, she decompensated rapidly, was intubated and subsequently died 3 days later. Imaging results showed, progressive ovarian cancer in the bowels. Blood culture revealed that she had E.Coli in her blood. It is thought that this is NOT related to the vaccine.	No prior vaccinations for this event.
OVARIAN NECROSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt. presented to the ER with abd pain and septic shock. Pt. reported to feel ill shortly after receiving the vaccine.	No prior vaccinations for this event.
OXYGEN SATURATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Is patient deceased: Yes; Low pulse; This is a spontaneous report from two contactable nurses reporting for a patient. A 70-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL0140 expiration date Mar2021) intramuscular on 22Dec2020 at 10:30 at single dose in right arm for COVID-19 immunisation. The patient was vaccinated at Nursing Home. Patient age at time of vaccination was 70 years. Patient's Medical History included ongoing Type 2 Diabetes Mellitus Without Complication onset	No prior vaccinations for this event.

date: admission 22Oct2020, ongoing morbid obesity due to excess calories onset date: admission 22Oct2020, cardiac disorder, essential hypertension, hypertension, schizophrenia, hyperlipidemia, benign prostatic hyperplasia (BPH), Gastrooesophageal reflux disease (GERD), depression, hypothyroid, epilepsy, pain, dry eyes, anxiety, restlessness, 17Jan2020 Slid out of chair to floor, no injury, on 27Jan2020, 28Jan2020, 29Jan2020 diarrhea noted. Concomitant medications included acetylsalicylic acid (ASPIRIN EC) for Cardiac Health, atenolol (ATENOLOL) for Essential Hypertension, atorvastatin calcium (ATORVASTATIN CALCIUM) for hyperlipidemia, finasteride (FINASTERIDE) for benign prostatic hyperplasia, tamsulosin hydrochloride (FLOMAX) benign prostatic hyperplasia, insulin glargine (LANTUS) for diabetes mellitus, lithium carbonate (LITHIUM CARBONATE) for Schizophrenia, losartan potassium (LOSARTAN POTASSIUM) for hypertension, lurasidone hydrochloride (LURASIDONE HYDROCHLORIDE) for Schizophrenia, omeprazole (OMEPRAZOLE) for gastrooesophageal reflux disease, sertraline hcl (SERTRALINE HCL) for depression, levothyroxine sodium (SYNTHROID) for hypothyroid, ergocalciferol (VIT D) for supplement, haloperidol (HALOPERIDOL) for Schizophrenia, levetiracetam (KEPPRA) for epilepsy, paracetamol (TYLENOL EXTRA-STRENGTH) for pain, propylene glycol (ARTIFICIAL TEARS) for dry eyes, lorazepam (ATIVAN) for a anxiety or restlessness. As antipyretic use was reported Tylenol ES (500 mg) Tab, 2 Tabs by Mouth Routine use three times a day given at time of vaccination and after. It was reported the patient was Covid+. He was tested on 21Dec2020 and was not admitted to hospital. Event Onset Date was reported as 24Dec2020 (clarification pending). On 30Dec2020 the patient was started on O2 at 2L for low pulse. O2 was increased over time to eventually O2 at 8L on 03Jan2021. Morphine Sulfate was started on 03Jan2021 at 5 mg sl/by mouth every 2 hours as needed for pain or airhunger. The patient deceased on 03Jan2021. The cause of death was unknown. It was not reported if an autopsy was performed. The AEs did not require a visit to Emergency Room or Physician Office. Outcome of Low pulse was unknown.; Sender's Comments: Based on the information available the events Death (unknown cause) and Heart rate decreased are attributed to patient's multiple underlying medical conditions including Type 2 Diabetes Mellitus, morbid obesity, cardiac disorder, hypertension, epilepsy etc. However, based solely on a vaccine-event chronological association, contributory role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to the above mentioned events cannot be completely excluded. The case will be reevaluated should additional information, including the cause of death, become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part

of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Is patient deceased: Yes

OXYGEN SATURATION ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received the Moderna COVID vaccine 1/28/21. He was tested for COVID 19 on 1/29/31. Results were received 1/30/21, at which time he was evaluated and found to be hypoxic with tachycardia. He was sent to the local ER and returned this same day. On 2/2/21, he was evaluated by the provider, who sent him to the emergency room with acute respiratory distress and poor O2 sats	No prior vaccinations for this event.

OXYGEN SATURATION ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt with acute resp failure, COVID PNA, that developed symptoms 9 days prior to admit and ultimately received first vaccine 6 days prior toa admit, then shortly after progressed with other covid symptoms and was admitted. She decompensated while intp and was transferred to ICU for rising O2 needs, ultimately had to be intubated. Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle. Sx and IR consulted and did beside exploration of hematoma. Initially blood pressure responded but overnight continued with refractory hypotension. Maxed out vasopressin and levophed, hemodynamics deteriorated. Pt passed soon after(2/2).	No prior vaccinations for this event.

OXYGEN SATURATION DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident had body aches, a low O2 sat and had chills starting on 12/30/20. He had stated that they had	No prior vaccinations

slightly improved. On 1/1/21 he sustained a fall with a diagnosis of a displaced hip fracture. On 1/2/21 during the NOC shift his O2 sat dropped again. He later went unresponsive and passed away.

for this event.

OXYGEN SATURATION DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Weakness, Low O2, death. Positive for COVID on 1/12/21, dies on 1/16/21 No prior vaccinations for this event.

OXYGEN SATURATION DECREASED **COVID19 (COVID19 (MODERNA)) (1201)**

Patient obtained initial dose of Moderna vaccine on Thurday, Jan 14. No adverse effects reported during initial 15 minute post vaccine waiting period. Saturday morning (Jan 16), patient developed severe cough, labored breathing, and fever. Additionally patient mental status changed suddenly, became non-communicative (unable to speak, but would scream if she was touched). O2 status was irregular, dropping to 78. Sunday morning, EMT and then hospice was hospice called. Monday morning, after hospice emergency kit was initiated, patient passed away.

No prior vaccinations for this event.

OXYGEN SATURATION DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

On the evening of 10JAN2021, patient experienced a low grade fever, decreased oxygen saturation of 38%, heart rate of 124, confusion. Patient received oxygen via face mask, morphine and ativan. By 11JAN2021, patient was no longer verbal, able to eat or communicate and was kept on comfort measure only. On the morning of 17JAN2021, the patient passed away.

No prior vaccinations for this event.

OXYGEN SATURATION DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Resident received the first dose of Moderna Vaccine on 01/12/2021 and Tested for COVID-19 on

Patient awake at 0300. When going into the room to get him ready for dialysis he was cold to touch, unresponsive other than to sound, and nonverbal. O2 sat was 67 via finger probe. Oxygen immediately initiated and a venturi mask retrieved and initiated. When unable to arouse him via sternal rub this RN called 911. Send to ED. Febrile 39.2 and hypotensive 58/43. Admitted. unknown after that as patient expired in hospital.		No prior vaccinations for this event.
OXYGEN SATURATION DECREASED		**COVID19 (COVID19**

	(MODERNA)) (1201)
2/2/21-1000-patient presented to the local emergency room with complains of fever, shortness of breath and decreased oxygen sats. temp 101.7, pulse 102, respirations 36, BP 141/92, oxygen 94%. Lung sounds crackles bilaterally with rhonchi on the left. patient worked up for sepsis, CXR shows mild atelectasis. blood pressure dropped, and continued to drop through treatment requiring levophed drop to be initiated. Patient POA determined that this would not be her sister's wishes and made the decision to make patient comfort care status. 2/3/21- patient lethargic throughout night. 0640-patient demise.	No prior vaccinations for this event.
OXYGEN SATURATION DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received his second dose of Moderna COVID vaccine on 2/6 at 12:40PM. Patient was observed for 15 minutes post-vaccination with no adverse events. On the evening of 2/6 (time unknown) the patient began to develop dry cough and fatigue. He was checked by a physician at that time (who was a family member). Patient continued to feel unwell into Sunday. His lungs were clear when checked Sunday afternoon (time unknown). At approximately 5:30pm on 2/7 the patient began experiencing sudden onset shortness of breath. A pulse ox was conducted at that time and it was 92%, and again shortly thereafter and it was 90% (as reported by family member). 9-1-1 was contacted at this time. CPR was initiated when he arrived at the emergency department, pulse ox was 60% (as reported by family member). The patient passed away shortly thereafter on 2/8/2021.	No prior vaccinations for this event.
OXYGEN SATURATION DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Almost immediate headache per wife. Developed fever around 4 pm. Headache all day. Took Tylenol at 4 and 10 pm. Gradual development of SOB and cough. Temp of 101.4 at 10 pm. pulse ox 92% at 10 pm. Went to sleep, woke up at 0050 with increasing SOB. Pulse ox 82%. Used albuterol inhaler, wife called emergency services at 0113. EMS arrived around 0130 to patient's home. pulse ox 86%, coughing, sob, hard time	No prior vaccinations for this event.

breathing. Walked to stretcher. Became unresponsive. Found to have no pulse, stopped breathing. CPR initiated at about 0140. King airway placed in field, I/O in left tibia. Patient from PEA to asystole, to vfib, to asystole. ACLS followed. Unrecoverable asystole and patient time of death 0213.

OXYGEN SATURATION DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient had Covid-19 in October of 2020. He recovered. He received the vaccination on 12/30/2020 with no complaints. On 01-05-2021 it was noted to he was incontinent of urine and bilateral lower extremity edema. Lab work was completed showed acute kidney injury. He had decreased blood pressure and oxygen saturations on 01-06-2021 He was admitted to the hospital with rapid progression of symptoms and suggested multi-system failure. He had a long cardiac history. On 01-14-2021 he passed away with a diagnosis of Cardiomyopathic CHF, A.Fib contributory.

No prior vaccinations for this event.

OXYGEN SATURATION DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

On 1/26 at breakfast table began vomiting. Continued thru am when at noon a caregiver did his O2 saturation and found it was 75%. This was confirmed, and resent sent to ER .

No prior vaccinations for this event.

OXYGEN SATURATION DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

1/31/2021 12:50 Nursing Note Note Text: Res had low BP, low O2 sats, 30 breaths per minute, eyes open wide, making confused utterances. Started supplemental oxygen via NC, 2L, then 3L. Sats went up to 93% for a while, Sprvsr called. Unable to auscultate Left lung sounds. Called to update Res daughter. Called to page NP, writer went back to assess Res and O2 sats were 88%, turned O2 to 4LPM, called 911 for transport to Hospital ED. Left around 1030. NP called back afterwards, was updated. Family updated that Res was sent to Hospital ED. Note Text: Received phone call from daughter as well as information from hospital. Resident

has pneumonia with septic shock. She is on abx and had thoracentesis performed for large pleural effusion. [linked]

OXYGEN SATURATION DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident tested NEGATIVE for COVID-19 last 1/25/2021. She was on monitoring for desaturation and low blood pressure on Jan. 27,2021	No prior vaccinations for this event.
OXYGEN SATURATION DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from	No prior vaccinations for this event.

which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

OXYGEN SATURATION DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient received dose 1 of Moderna Vaccine on 1/14/21 administered by pharmacy. Patient was hospitalized on 1/31/21 due to shortness of breath and diminished O2 sats down to 88%. Patient was in atrial fibrillation. Patient discharged from hospital on 2/25/21 to home. Patient received dose 2 of Moderna Vaccine on 2/25/21 prior to discharge from hospital. Last hospital note stated that patient was pleasant and cooperative with good motivation. Patient passed away after discharge from the hospital on 2/26/21. Patient's son called the hospital to report his passing.

No prior vaccinations for this event.

OXYGEN SATURATION DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Resident became SOB, congested and hypoxic requiring oxygen, respiratory treatments and suctioning. Stabilized after treatment and for the next 72 hours with oxygen saturations in the 90s. On 1/3/2021 was found without pulse and respirations. Resident was a DNR on Hospice.

No prior vaccinations for this event.

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids	No prior vaccinations for this event.

were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low

No prior vaccinations for this event.

oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.

OXYGEN SATURATION DECREASED	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.	No prior vaccinations for this event.

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also	No prior vaccinations for this event.

received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

OXYGEN THERAPY

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to	No prior vaccinations for this event.

ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy

(albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

PAIN

COVID19 (COVID19 (MODERNA)) (1201)

Resident had body aches, a low O2 sat and had chills starting on 12/30/20. He had stated that they had slightly improved. On 1/1/21 he sustained a fall with a diagnosis of a displaced hip fracture. On 1/2/21 during the NOC shift his O2 sat dropped again. He later went unresponsive and passed away.

No prior vaccinations for this event.

PAIN

COVID19 (COVID19

(MODERNA)) (1201)

Found dead at home slumped on the floor; Loss of appetite; Body aches; Feverish; A spontaneous report was received from a physician, concerning a 65-years-old male patient, who received Moderna's COVID-19 Vaccine and experienced feverish, body aches, loss of appetite, and death. The patient's medical history, as provided by the reporter, included diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia. Concomitant medications reported included metformin, glimepiride, lisinopril, atorvastatin, aspirin, methimazole, propranolol, and cilostazol. On 05 Jan 2021, prior to the onset of events, the patient received the first of two planned doses of mRNA-1273 (lot number 037k20a) for COVID-19 infection prophylaxis. On an unknown date in Jan 2021, some time after receiving the vaccine, the patient was feeling feverish with body aches and loss of appetite. On 09 Jan 2021 at approximately 21:30, the patient was found dead at home slumped on the floor. According to the paramedics, the patient was dead longer than when his wife found him, and no resuscitation was performed. Action taken with mRNA-1273 in response to the events was not applicable. The outcome of the events, feverish, body aches, loss of appetite, was considered resolved. The patient died on 09 Jan 2021. The cause of death was not reported. The reporter assessed the event, death, as not related to Moderna's COVID-19 Vaccine. The reporter did not provide assessment for the events, feverish and body aches, in relation to Moderna's COVID-19 Vaccine.; Reporter's Comments: This case concerns a 65 year old male patient with medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia, who experienced the serious unexpected event of death, non-serious unexpected event of loss of appetite, and non-serious expected events of fever and body pain. The event of death occurred 5 days after the first dose of mRNA-1273. The events of fever, body pain and loss of appetite occurred an unspecified period of time after the first dose of mRNA-1273. Very limited information regarding these events has been provided at this time. Based on temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Definitive causal association is confounded by age and medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and

No prior vaccinations for this event.

hypertriglyceridemia.

	Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.	No prior vaccinations for this event.

	PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen		No prior vaccinations for this event.

levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease	No prior vaccinations for this event.

progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or

if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

PAIN

COVID19 (COVID19 (PFIZER-BIONTECH))

		(1200)
Resident received the 2nd dose of the Covid vaccine approximately around 1105 by pharmacy through the pharmacy LTC partnership vaccination program. Resident had no adverse effects until around 8:00 pm she began complaining of body aches, and chills, Tylenol was given at this time. Around 9:30pm resident was sleeping in bed. Around 12:00 am the CNA called nurse into room to assess resident as the resident stated she did not feel good. Temperature at that time was 102.2, and vomiting. RN came to assess @ 1220 am She was noted to be vomiting, diaphoretic, pale and having trouble breathing. Temp was 97.3 after vomting, Pulse 53, Resp 20, o2 sats were 40-45%, unable to obtain Blood pressure, Applied 5 L of oxygen at this time and had LPN call 911 immediately. Resident was repsonsive and able to follow staff members instructions but was only answering yes or no simple questions at the time time of assessment. Paramedics arrived at 0040 and resident was sent to Hospital. @ 0130 ER nurse called to nursing facility to notify resident had coded in the ER and passed away @ 0110. PAIN IN EXTREMITY		**COVID19 (COVID19 (MODERNA)) (1201)**
My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.	No prior vaccinations for this event.

Patient received vaccination on 2/4. Patient's wife reported that he felt a slight soreness in his arm the day following the shot, but had no other symptoms. On 2/8 he passed away. Wife reports that it was related to his heart and they never made it to a hospital. The wife also reported that the patient had been in poor health prior to the vaccination		No prior vaccinations for this event.
	PAIN IN EXTREMITY	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient had the first Moderna Covid vaccine on Thursday 1/21/2021. She had a bit of sore arm on that day and the day after. On Saturday 1/23/2021, she had a fever of 100.5 F (11AM), nausea, light headache and chills. The temperature went down after she took ibuprofen. Patient's husband enrolled her to V-Safe to report all the adverse effects she experienced. On Sunday 1/24/2021, her temperature was 98.3F. She still had		No prior vaccinations for this event.

nausea and no appetite. She and her husband watched a football game in their bedroom upstairs. Husband noticed that his wife was pacing around the room many times. At 7Pm, Husband went downstairs for dinner but she refused to come down to eat. He went upstairs around 8pm, TV was still on. He turned off TV and went down stairs again thinking his wife felt as sleep while watching TV. He went back upstairs for bed around 10:30 PM. Husband said his wife had a deviated septum so she would snore very loudly when asleep. He didn?t hear her snoring so he went to check on her and found her not responsive. Husband called emergency services. Paramedic came at 10:45 and said patient was passed. Husband sent many texts to V-safe after that to report the incident. No response was received from V-safe. Patient?s doctor told her husband that she died due to cardiac arrest.

PAIN IN EXTREMITY

COVID19 (COVID19 (MODERNA)) (1201)

"The patient came to the Emergency Room at approx 3:30 am on 02/03/2021 with pain in right arm (same arm the COVID vaccine had been administered in approx 12 hours earlier) and feeling generally unwell. Patient was concerned about possibility of gout flare or that something was wrong with her arm. Elevated blood pressure was noted; this was attributed to anxiety. She was evaluated, given 500 mg Tylenol, and discharged since the pain was decreasing and blood pressure was stabilized. Patient instructed to follow-up with physician. The next day, on 02/04/2021, the patient arrived at the Emergency Room by ambulance; cardiac arrest was the chief complaint. The patient's daughter stated the patient had been ""feeling generally poor and then suddenly collapsed."" Daughter described ""gurgling respirations"" and being unresponsive. 911 was called, police arrived within 5 minutes and initiated CPR. Epinephrine, atropine, lidocaine and bicarb administered after arrival to Emergency Room. Shockable rhythm never demonstrated. Patient never recovered spontaneous respiration or movement. The death was called at 23:04. Coronary artery disease with cardiac arrest is the cause from the ER records; the coroner is putting COVID-19 vaccination in Part 1 of the death certificate."

he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for		No prior vaccinations for this event.

vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

Narrative: Patient experienced cardiac arrest with PEA and a witnessed collapse upon arrival to the emergency department on 1/24/21. Patient received his first dose of the COVID vaccine on 01/15/2021and felt poorly thereafter. He was describing shortness of breath to his wife and requiring 5L of O2 at home to maintain saturations in 80s, while he usually was on 3L to maintain saturations in the mid 90s. He had been oriented but more fatigued than normal and described bilateral shoulder pain (which was not new for him) as well as indigestion. Took Tylenol with some relief. He had decreased PO intake and less appetite. The patient's wife encouraged him to come to the hospital daily for a week prior to admission, but the patient did not want to because he felt his side effects were secondary to the vaccine. Symptoms:RespDepression, Palpitations, Syncope & cardiac arrest Treatment: EPINEPHRINE 1 MG ONCE 3 rounds given ,CALCIUM CHLORIDE 1000 MG ONCE

PARACENTESIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 71 yo male who passed away on 1/29/2021, medical cause of death ""cholangiocarcinoma, interval between onset and death 14 months. Since patient passed away within 42 days of the covid19 vaccine administration, we are required to complete a report to VAERS. Vaccine (Pfizer) was administered without complications. The patient denied any prior severe reaction to this vaccine or its components or a severe allergic reaction such as anaphylaxis to any vaccine or to any injectable therapy. Synopsis- 1/23 71 yo male presented to ED with upper GI bleed. PMH: DM, HTN, cholangiocarcinoma of biliary tract requiring recurrent paracentesis, COPD, perigastric and lower esophageal varices (not on beta blockers due to bradycardia). Pt has had 2 episodes of coffee ground emesis. Lactic 2.6, ammonia 52. Rec'd protonix, octreotide, and ceftriaxone in ED. Family has been previously encouraged to speak to palliative care but has never been willing to. GI consulted. 1/24 EGD completed. No signs of active bleed. MDs recommending hospice. CT + for small bowel ileus. 1/26 Requires placement of NG tube to suction. Palliative care consulted. 1/27 Paracentesis completed. 4100mls removed. 1/28 Pt changed to palliative	No prior vaccinations for this event.

status. 1/29 Pt passed away."

	PARALYSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.		No prior vaccinations for this event.

[COVID-19 mRNA vaccine (Pfizer-BioNtech] treatment under Emergency Use Authorization (EUA)		No prior vaccinations for this event.
	PAROSMIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.		No prior vaccinations for this event.
	PATIENT ISOLATION	**COVID19 (COVID19 (MODERNA)) (1201)**
This is the patient who passed away 2d after his second COVID vaccine. Of note, the 2/8 telephone note makes it sound like he was hospitalized at time of death - that is incorrect. His daugther listed as EM contact works in the eye clinic here. He had mild illness, completed 10d isolation but missed his scheduled booster dose on 2/2 due to isolation. He was called on 2/5 when there was a booster visit cancellation and received his booster dose on that day. His daugther reported that he was doing fine and looking well on 2/7 AM, ate breakfast, shortly after stood up and just collapsed.		No prior vaccinations for this event.
	PCO2 DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR		No prior vaccinations for this event.

status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.

PCO2 INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.

No prior vaccinations for this event.

PCO2 INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis

No prior vaccinations for this event.

involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

PCO2 NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.
PEMPHIGOID	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient (now deceased) received 1st dose of Pfizer-BioNTech vaccine around December 21, 2020 and was noticed to be scratching, fatigued, and unresponsive by a family member on December 24, 2020. He received the second dose of the same vaccine around January 22, 2021. Pockmarks and bleeding scratch marks were noted by a family member on the patient's face prior to this second dose. On January 28, 2021 a family member was alerted that the patient was suffering from severe bullous pemphigoid- a skin condition that has never been experienced by the patient, has been reported to be related to COVID-19 viral infection, and to T-	No prior vaccinations for this event.

cell responses promoted by vaccines. A corticosteroid was given, but did not work. Blisters developed to the point hands had to be dressed.

PERICARDIAL EFFUSION		**COVID19 (COVID19 (MODERNA)) (1201)**

The patient experienced cardiac arrest due to pericardial effusion on 21Feb2021 14:15, fever on 13Feb2021, headache on 13Feb2021, stomach upset on 13Feb2021, on 19feb, he began to feel ill again with a fever, he felt worse on 20feb on 19Feb2021, on 21feb he went to	No prior vaccinations for this event.	

the ER after vomiting and passing out on 21Feb2021. Events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of cardiac arrest due to pericardial effusion. Course of events: In Feb2021, 10 days after his 1st injection, the patient developed fever, headache, and stomach upset. He went for a rapid Covid-19 test (nasal swab) and it was negative on 11Feb2021. The doctor told him he might be having a delayed reaction to the vaccination. After a couple of days, he improved. On 19Feb2021, he began to feel ill again with a fever. He felt worse on 20Feb2021. On 21Feb2021 he went to the ER after vomiting and passing out and received treatment: IV fluids, diagnostic testing at ER. Rapid Covid test (nasal swab) at ER came back negative again on 21Feb2021. His heart arrested suddenly and he could not be resuscitated. CT scan results, that came back after death, showed Covid like pneumonia and pericardial effusion. The patient died on 21Feb2021 14:15. Cause of death was cardiac arrest due to pericardial effusion. An autopsy was not performed. The outcome of cardiac arrest due to pericardial effusion was fatal, of fever, headache, stomach upset was recovering, of he began to feel ill again with a fever, he felt worse was not recovered, of he went to the ER after vomiting and passing out was unknown.; Reported Cause(s) of Death: cardiac arrest due to pericardial effusion; cardiac arrest due to pericardial effusion		
PERICARDITIS		**COVID19 (COVID19 (MODERNA)) (1201)**
"The decedent experienced severe chest pain and dyspnea approximately nine days following the first series of the vaccine. He reported to family members that he was having a ""severe reaction"" to the vaccine and believed it was acute pericarditis due to the same symptoms he experienced prior. He reported that on 2/1/21 around 0300 hours, the symptoms were the most severe and he was going to seek medical attention, but did not. He waited till the convenient store opened and purchased OTC Tylenol for relief of symptoms. He continued to have dyspnea and chest pain up until 2/9/21, when he called 911 complaining of chest pain and was found to have a STEMI; subsequently died at Hospital in the ER."	No prior vaccinations for this event.	
PERIORBITAL OEDEMA		**COVID19 (COVID19 (PFIZER-BIONTECH))**

(1200)

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely.""

No prior vaccinations for this event.

1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan

10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

PERIPHERAL COLDNESS		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awake at 0300. When going into the room to get him ready for dialysis he was cold to touch, unresponsive other than to sound, and nonverbal. O2 sat was 67 via finger probe. Oxygen immediately initiated and a venturi mask retrieved and initiated. When unable to arouse him via sternal rub this RN called 911. Send to ED. Febrile 39.2 and hypotensive 58/43. Admitted. unknown after that as patient expired in hospital.		No prior vaccinations for this event.
PERIPHERAL COLDNESS		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received COVID19 vaccine at clinic at 11:52 am, discharge post treatment stable. Got home around 2:30 pm went to bed. He usually got tired post dialysis. He did not wake up at 6 pm. His wife went check on him. found patient cold and unresponsive. 911 pulseless PEA. ER Medical hospital. Pronounced death at 7:40 pm		No prior vaccinations for this event.
PERIPHERAL COLDNESS		**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival.		No prior vaccinations for this event.

CPR was continued until family could be reached and decision was made to stop resuscitation.

	PERIPHERAL COLDNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On December 17, 2020, my husband, received his first BioNTech BNT162b2 COVID-19 vaccination. On Thursday January 7, 2021, he received this second COVID-19 vaccination. The following three days after his second vaccination, he felt fine. The fourth day, on Sunday January 10, my husband felt extremely fatigued. On Monday the 11th and Tuesday the 12th, he worked a full shift but complained of extreme fatigue and extreme chills to the point that his teeth were chattering while on the phone with me. He decided to work through it. When he got home on Monday night, he started vomiting. On Wednesday January 13, he woke up and had swollen eyes. Once again, he felt extremely fatigued, even after a full nights rest. He had the day off but had an early meeting. After his meeting, he was still tired so he went back to sleep. I left to get lunch, and drop off our kids, and upon my return, I found him on the walk in closet floor, face up, having passed away. He felt as cold as ice. The rapid test done after they called the paramedics resulted in a negative COVID-19 test for him.		No prior vaccinations for this event.

	PERIPHERAL COLDNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/7/21 Increased difficulty chewing, swallowing, evaluated by SLP and dietician. Diet texture down-graded x 2 with poor appetite and recent 6lb weight loss. 2/8/21-APRN updated regarding poor appetite and difficulty chewing as well as downgraded texture of diet. Also informed of increased s/s of discomfort and increased use of PRN Oxycodone for pain. 2/9/21- elevated temp 100.7. 2/9/21 Covid pcr test negative. 2/9/21- N.O.?s APRN BMP, Albumin and Pre-albumin Level in am. 2/11/21-elevated temp 100.4. Covid rapid test negative. 2/12/21- CBG recorded at 517 at 5:20 am. Resident also has an elevated temp of 100.9. Tylenol		No prior vaccinations for this event.

administered per order. Vital signs include resp 24, radial pulse 134, O2 sat 83%. Supplemental oxygen administered via nasal cannula. Head of bed elevated. DR. notified at time via telephone. Order given for sliding scale for CBG. Guardian updated regarding changes in residents condition, poor prognosis. Guardian requests Hospice eval and admit. Guardian requests comfort care no hospitalization, no IV's, no G-tubes, no labs etc, D/C of Palliative services. ARNP informed. 2/12/21 Acute Telehealth visit with APRN due to increased lethargy, elevated CBG?s despite poor appetite and insulin administration. Resident unresponsive to verbal and noxious stimuli at time of visit. N.O. Morphine sulfate 20mg/ml, give 2.5mg PO/SL Q4hr PRN pain/shortness of breath. 2/12/2021-Admitted to Hospice, Lethargic, diaphoretic, T 98.1 P 130's R 18 O2 high 80's to low 90's via O2 mask at 3L. 2/12/2021- Resident legs and arms noted to feel cool this afternoon, 02 sat was 97% with 02 on @ 3L with mask Noted resident with sob and increased pulse. Prn morphine 0.25ml sl. given with good effect. Resident was less restless and quiet in her bed. Checked on resident several times this shift for needs. Resident noted to not move in her bed @ 8:15pm and noted she was not breathing. Supervisor called and pronounced resident deceased.

PERIPHERAL COLDNESS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

On the evening of 2/23/221 at 9:00 pm, resident reported feeling SOB, BP 80/44, Pulse 53, O2Sat 95% on 3L oxygen, hands cold, pulse weak. Temp 92.5F MD notified. EMS activated. EMS arrival and HR 20. Family refused transport to ER. Resident expired at 2:40 am on 2/24/21 Meds continued: duloextine, VITd2,hydralazine, synthroid, lisinopril, mag ox, folplex, pantoprazole, potassium chloride, ellipta, ensure, hydrocortisone cream, boost, deprox, xanax, morphine, lorazepam, tylenol, albuterol inhlation, ventolin inh.

No prior vaccinations for this event.

PERIPHERAL SWELLING

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Legs started swelling and shortness of breath Thursday January 21 2021 Was rushed to hospital with kidney failure and fluid build up around lungs and entire body Blood pressure dropped and had multiple organ failure	No prior vaccinations for this event.	
PERIPHERAL SWELLING		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Swollen leg/pain- taken to urgent care- became unresponsive - CPR initiated- expired	No prior vaccinations for this event.	
PERIPHERAL SWELLING		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt develops left leg pain The day after vaccination in AM subsequently drove approximately 150 miles On his way back stopped at his brothers place for lunch. He then collapsed coning down the steps, EMS started CPR. took him to ER Resuscitated briefly but went into CardioPulm Arrest again and PEA Resucitaion for aprox 1 hour but was unsuccessful. Noted to have Left leg more swollen than Right by 3 to 4 CM presumed to have died from massive Pulmonary embolism and inferior wall myocardial ischemia	No prior vaccinations for this event.	
PERIPHERAL SWELLING		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
