right arm swelling immediately after injection. followed by bilateral lower leg edema, chills and body aches that continued daily at 2 weeks post immunization admin 2/4/21 treated with dexamethasone 6mg PO x 7 days- this resolved his s/s 2/13/21 patient passed away at facility	No prior vaccinations for this event.	

	PERIPHERAL SWELLING	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
L hand edema, hematoma which burst and caused bleeding sending pt to the ER for pressure dressing and 2 stitches. L hand and arm progressively got more edematous and bruised looking (severely black/blue/purple) and the hand continued to bleed and swell on 2/6/21. Severe arterial and venous issues and apparent blood clots. On 2/7/21 there were also lumps noted on left inner thigh. Pt. stopped eating or drinking on 2/8/21 and expired on 2/12/21.		No prior vaccinations for this event.
	PERIPHERAL SWELLING	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was into the clinic on the afternoon of 2/23/21 for a COVID-19 vaccine. He had a podiatry clinic visit after his vaccine same day. It was reported by the patients family physician that patient stated he didn't feel well and suddenly collapsed at home at approximately 4:45 pm. Emergency medical personnel were not able to revive him. Patient died at approximately 4:45 pm on 2/23/21.		No prior vaccinations for this event.
	PERIPHERAL SWELLING	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to		No prior vaccinations for this event.

death of patient prior to lab company arrival.

	PERIPHERAL SWELLING	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
	heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on 17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting	No prior vaccinations for this event.

to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

PERITONEAL LAVAGE

COVID19 (COVID19 (MODERNA)) (1201)

Pt. presented to the ER with abd pain and septic shock. Pt. reported to feel ill shortly after receiving the vaccine.

No prior vaccinations for this event.

PETECHIAE

COVID19 (COVID19 (MODERNA)) (1201)

Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).

No prior vaccinations for this event.

PETECHIAE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received dose #1 of COVID-19 vaccine on 1/16/21. Within 3 days, she developed petechiae up to ankles, later rising up to her knees. Pt admitted to hospital on 2/6/21 for symptomatic anemia 2/2 vaginal bleeding. Patient received 4 units FFP, 4 units PRBC, 1 unit cryoprecipitate, and vitamin K 5 mg IV. Also

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT

No prior vaccinations for this event.

revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

PH URINE NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency

investigation is ongoing. Spouse believes that her death was caused by the vaccine.

PHARYNGEAL SWELLING	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
73-year-old man s/p first dose of Pfizer at 10:20 AM Ambulated comfortably to exit after 20 minutes in observation but 10:45 collapsed while exiting the building 10:47 CPR initiated 10:49 medical team/EMS found no pulse, agonal respirations, ventricular fibrillation Paramedics and team performed ACLS; of note patient was intubated 7.5 ETT with bilateral breath sounds on ventilation; paramedic reported easy intubation with no apparent throat swelling; 11:02 transported to Emergency Department 11:30 Pronounced dead at Emergency Department	No prior vaccinations for this event.

PHYSICAL EXAMINATION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also	No prior vaccinations for this event.

received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

PLATELET COUNT DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/12/2021 Vaccine 2/13/2021 Weakness, oral ulcers 2/17/2021 Brought to ER for loss of consciousness, altered mental status, rectal bleeding; work up showed sepsis, UTI, anemia, pneumonia, pleural effusion, pancytopenia, hypotension; persistent hypotension and respiratory failure 2/18/2021 Passed away at 5:54AM	No prior vaccinations for this event.
PLATELET COUNT INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient presented to Vaccine clinic 1/12/21 to receive COVID vaccination. Patient denied any ill feeling, no fever, cleared for vaccination. Is chronically SOB due to COPD, but patient reported no different than usual. Presented to the ED the next day c/o SOB and weakness for the last week. Patients condition ultimately declined over the next few days and died 01/21/21 from pneumonia (not COVID). Patient did admit she lied about her symptoms on the day of vaccination to get the shot.	No prior vaccinations for this event.
PLATELET COUNT NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient presented to emergency room on 2/1/2021 with a chief complaint of having a chronic headache and fatigue following receipt of the Moderna vaccine 10 days prior. Following examination by the physician, the patient was diagnosed with an acute subdural hematoma. The patient subsequently underwent decompressive surgery, however demonstrated worsening neurologic status over the next several days and ultimately expired on 2/4/2021.	No prior vaccinations for this event.

PLATELET COUNT NORMAL

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE,

No prior vaccinations for this event.

no acute PE.

PLATELET COUNT NORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021		No prior vaccinations for this event.
PLATELET COUNT NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.		No prior vaccinations for this event.
PLATELET COUNT NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p		No prior vaccinations for

multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.		this event.
	PLATELET COUNT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21		No prior vaccinations for this event.
	PLATELET COUNT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

1/18/2021- Tested positive for Covid-19. 1/20 Patient lethargic, unable to swallow. 1/24 Although 90% O2 sat on RA, it has decreased from her baseline ranging at high 90's. 1/27/2021 Patient passed.	**PLATELET COUNT NORMAL**	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)** No prior vaccinations for this event.
Lethargic, refusing medications and meals. 1/11/2021- Covid+, poor appetite. No prior vaccinations for this event.	**PLATELET COUNT NORMAL**	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/14/2021-0545, blood noted left and right ear. 0715, vomited x 1. Covid Antigen positive. Acute MD visit-basilar crackles right and coughing. Increased confusion.	**PLATELET COUNT NORMAL**	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)** No prior vaccinations for this event.
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension.	**PLATELET COUNT NORMAL**	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)** No prior vaccinations for this event.

Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement

of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

PLATELET COUNT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently	No prior vaccinations for this event.

to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

PLEURAL EFFUSION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to	No prior vaccinations for this event.

decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

PNEUMONIA

COVID19 (COVID19 (MODERNA)) (1201)

Resident became lethargic and reports of blood coming from resident's nose and mouth on the morning of 1/13/21. Resident went out to ER for eval, and came back to facility with dx of pneumonia and recommendations for resident to be placed on hospice. Resident deceased on 1/14/21. Unknown if vaccine related, but with timeline of events I was advised to report this per medical director of facility, as well as Pharmacy who administered the vaccine.

No prior vaccinations for this event.

PNEUMONIA

COVID19 (COVID19 (MODERNA)) (1201)

Patient presented to Vaccine clinic 1/12/21 to receive COVID vaccination. Patient denied any ill feeling, no fever, cleared for vaccination. Is chronically SOB due to COPD, but patient reported no different than usual. Presented to the ED the next day c/o SOB and weakness for the last week. Patients condition ultimately declined over the next few days and died 01/21/21 from pneumonia (not COVID). Patient did admit she lied

	PNEUMONIA	**COVID19 (COVID19 (MODERNA)) (1201)**
	The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.	No prior vaccinations for this event.

COVID-19; COVID-19; Pneumonia; respiratory failure; This is a spontaneous report from a contactable		No prior vaccinations for

consumer. An 80-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 02Jan2021 for COVID-19 immunization. Medical history included Alzheimer's and others. No known allergies. Concomitant medications included unspecified medications. The reporter's mother in law was tested for COVID-19 at a nursing facility on 25Dec2020 and she was negative. On 02Jan2021, she received the first dose of Pfizer vaccine. On 04Jan2020, she developed a high fever, needed oxygen and was positive for COVID-19. Date of death was 04Jan2021. The cause of her death was listed as pneumonia, respiratory failure and COVID-19. No autopsy performed. No treatment received. No one knew if the vaccination contributed to her death. It was hard to know if her death was due to the administration of the vaccine or it exacerbated the COVID19 symptoms which led to her death. Since this was unknown, it could have been a possibility. The reporter wanted to give us this information because we might want to consider having high risk population, patients with underlying conditions, older population tested for COVID-19 prior to the vaccination, as this is not currently a recommendation or a requirement. All is very new and they are all learning so the reporter wanted to share this information with us. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There are medications the patient received within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The outcome of the events was fatal. Information about Lot/Batch has been requested.; Sender's Comments: The association between the fatal event lack of effect (pneumonia, respiratory failure and COVID-19) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19

PNEUMONIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19.""	No prior vaccinations for this event.	

Patient expired 1/24/2021."

	Began having SOB and cough on 2/18/21, the day after his first vaccine. Had a routine physician appointment for diabetes on 2/15/21 with no documentation of these complaints. Presented to the hospital on 2/23, soon after required intubation. Admitted with severe pneumonia, diffuse colitis, and sepsis. Condition continued to worsen until patient passed away on 2/24/21 @ 1632.	No prior vaccinations for this event.

	PNEUMONIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
	Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival	No prior vaccinations for this event.

he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was

diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

emesis bright yellow in color, liquid BM, increased respirations No prior vaccinations for this event.

PNEUMONIA ASPIRATION **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

My father was in weak condition to begin with. He didn't get out of bed for the next few days after receiving the vaccine. The little amount that he ate was consumed in bed. He began aspirating his food which lead to pneumonia. He wasn't strong enough to fight off the pneumonia even with antibiotics. He died on 1/23/21. While he might have passed soon in any case, I believe that the vaccine may possibly have increased his weakness/exhaustion thereby hastening his demise.

No prior vaccinations for this event.

PNEUMONIA ASPIRATION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status:

No prior vaccinations for this event.

SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

PNEUMONIA ASPIRATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Death Narrative: Patient received first dose of COVID vaccine on 1/30/21. Reported by his wife to agency that he passed away at an outside hospital on 2/14/21. By report of his wife: ""due to sepsis (related to bed sores) and aspiration pneumonia"""	No prior vaccinations for this event.
PNEUMONIA BACTERIAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Approximately 2 weeks after the first COVID vaccine she developed shortness of breath that was much more significant than she had previously. This was the first time she had expressed this symptom to me as being something she was concerned about and difficult for her to manage (we have spoken almost daily for many years). Within 24 hours of the second dose of the mRNA vaccine, they called an ambulance to get her and she was taken to the hospital and diagnosed with bacterial pneumonia. The doctors said it was	Breathing issues ~2 weeks after first dose of mRNA vaccine in the series but were not nearly as acute or severe as they were fol

unrelated, but I found a study with a different vaccine (LAIV) that also seemed to increase the incidence of bacterial pneumonia. They hypothesized through diverting the immune system. So while I don't think the vaccine gave her the bacteria, I do think it may have caused her immune system to be temporarily compromised allowing the bacteria to grow out of control. I feel this is important to report to look for these types of patterns as perhaps it can help others avoid the death spiral that happened to my mother. There were also intervening events between her hospitalization and her death including two successful surgeries (one for a broken hip and another to put in stents in her leg). So to summarize, the first vaccine was within about 2 weeks of the onset of her breathing problems. Within 24 hours of the second vaccine she was hospitalized and diagnosed with bacterial pneumonia. As she was battling bacterial pneumonia in the hospital she broke her hip and was found to have reduced peripheral circulation and had 2 surgeries to correct those. They were successful according to the surgeons, however she died within a week or so of the surgeries. She had other comorbidities as well which I'm sure predisposed her such as diabetes, hypertension and cancer for many years.

PNEUMONITIS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized

No prior vaccinations for this event.

further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib

PNEUMONITIS CHEMICAL	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20	No prior vaccinations for this event.

without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending

work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

	PNEUMOTHORAX	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
	heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on 17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a	No prior vaccinations for this event.

result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

PO2 INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.

No prior vaccinations for this event.

PO2 NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was

No prior vaccinations for this event.

at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He

No prior vaccinations for this event.

complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA,

Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

POOR PERIPHERAL CIRCULATION

COVID19 (COVID19 (MODERNA)) (1201)

Approximately 2 weeks after the first COVID vaccine she developed shortness of breath that was much more significant than she had previously. This was the first time she had expressed this symptom to me as being something she was concerned about and difficult for her to manage (we have spoken almost daily for many years). Within 24 hours of the second dose of the mRNA vaccine, they called an ambulance to get her and she was taken to the hospital and diagnosed with bacterial pneumonia. The doctors said it was unrelated, but I found a study with a different vaccine (LAIV) that also seemed to increase the incidence of bacterial pneumonia. They hypothesized through diverting the immune system. So while I don't think the vaccine gave her the bacteria, I do think it may have caused her immune system to be temporarily compromised allowing the bacteria to grow out of control. I feel this is important to report to look for these types of patterns as perhaps it can help others avoid the death spiral that happened to my mother. There were also intervening events between her hospitalization and her death including two successful surgeries (one for a broken hip and another to put in stents in her leg). So to summarize, the first vaccine was within about 2 weeks of the onset of her breathing problems. Within 24 hours of the second vaccine she was hospitalized and diagnosed with bacterial pneumonia. As she was battling bacterial pneumonia in the hospital she broke her hip and was found to have reduced peripheral circulation and had 2 surgeries to correct those. They were successful according to the surgeons, however she died within a week or so of the surgeries. She had other comorbidities as well which I'm sure predisposed her such as diabetes, hypertension

Breathing issues ~2 weeks after first dose of mRNA vaccine in the series but were not nearly as acute or severe as they were fol

and cancer for many years.

POSTHAEMORRHAGIC HYDROCEPHALUS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."	No prior vaccinations for this event.
POSTOPERATIVE WOUND INFECTION	**COVID19 (COVID19 (MODERNA)) (1201)**

Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse	No prior vaccinations for this event.

POSTURE ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Staff reported that patient was found Friday morning (Jan 8) sitting at a table with his head tilted forward and unresponsive to verbal or physical stimuli. Staff lowered patient to floor and started CPR. EMS was called and continued CPR at scene, however they were not able to revive patient. Patient was pronounced dead at the scene. Staff written statements following the death of patient show that he had a fall about 1 hr. prior. It is unknown if this fall contributed to patient's death. An autopsy has been requested.	No prior vaccinations for this event.

POSTURE ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
patient received vaccine on 1/20/2121, later that night husband found her slumped in chair, called EMS and patient was taken to Hospital where she died on 1/21/2021	No prior vaccinations for this event.

POSTURE ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
passed away; cough; This is a spontaneous report from a contactable consumer, the patient's daughter. A 92-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration in the left arm on 13Jan2021 at 11:00 (at the age of 92-years-old) as a single dose for COVID-19 immunization. Ongoing medical history included nursing home resident, admitted to hospice on 13Jan2021 (prior to vaccination), and oxygen supplementation (due to low oxygen levels) from a few days prior to the vaccine (Jan2021). Other relevant medical history included congestive heart failure from Dec2020 and sulfa allergy. Prior to the vaccination, the patient was tested numerous times (as reported) for COVID-19 and was negative. There were no concomitant medications. The patient did not receive any other vaccines within four weeks prior to the vaccination. A few days before the vaccination, her oxygen level had gone down, and she had been placed on oxygen. Prior to receiving the vaccine, the patient was reported as being 'fine'. On 13Jan2021, the patient received the vaccine at 11:00. The patient coughed maybe 5 or 6 times and then dropped her head. Resuscitation was not performed as patient had a do not resuscitate (DNR) order. The patient passed away on 13Jan2021 at 13:05. The cause of death was not reported. An autopsy was not performed. The clinical outcome of the cough was unknown at the time of death. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Reported Cause(s) of Death: passed away	No prior vaccinations for this event.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated

No prior vaccinations for this event.

ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

Resident unresponsive to verbal and noxious stimuli at time of visit. N.O. Morphine sulfate 20mg/ml, give 2.5mg PO/SL Q4hr PRN pain/shortness of breath. 2/12/2021-Admitted to Hospice, Lethargic, diaphoretic, T 98.1 P 130's R 18 O2 high 80's to low 90's via O2 mask at 3L. 2/12/2021- Resident legs and arms noted to feel cool this afternoon, 02 sat was 97% with 02 on @ 3L with mask Noted resident with sob and increased pulse. Prn morphine 0.25ml sl. given with good effect. Resident was less restless and quiet in her bed. Checked on resident several times this shift for needs. Resident noted to not move in her bed @ 8:15pm and noted she was not breathing. Supervisor called and pronounced resident deceased.

PRESYNCOPE	**COVID19 (COVID19 (MODERNA)) (1201)**
Moderna Vaccine Lot 029K20A Patient received second dose of vaccine on 2/2/21. Within 30 minutes patient had a near syncopal episode. She felt lightheaded and shortly after had episode of nonbloody vomiting. Hypotensive 81/69 and started on levophed. Alert and orientated. Lungs clear, abdomen benign on admission. Patient had no reaction when received first dose of the vaccine. Patient developed worsening shortness of breath, tachypnea, Afib with RVR, hypotension and required intubation and multiple pressors.	No prior vaccinations for this event.

PRESYNCOPE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Per EMS, the patient was last seen walking and talking to wife 10 minutes prior to EMS arrival. EMS reports via patients wife, that patient was upstairs to change for his doctor appointment then patient's wife found	No prior vaccinations for this event.

him down. The patient received his COVID-19 vaccine on 1/25/21. EMS states they gave 5 rounds of EPI then patient moved into vfib then was shocked once but returned to asystole. In ED, the patient initially in asystole CPR was started immediately. The patient was given 3 rounds EPI, 1 round bicarb. The patient stayed in PEA throughout. Patient was given tPA. Patient continued to be in asystole and time of death was called at 11:35 am.

PROCALCITONIN DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass	No prior vaccinations for this event.

away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.		No prior vaccinations for this event.

	PROCALCITONIN INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR		No prior vaccinations for this event.

unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."

PROCALCITONIN INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral	No prior vaccinations for this event.

pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some

time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

PROCALCITONIN INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable

No prior vaccinations for this event.

to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.

PRODUCT USE ISSUE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200	No prior vaccinations for this event.

mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil

exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

PRODUCTIVE COUGH

COVID19 (COVID19 (MODERNA)) (1201)

Pt received second dose of COVID vaccine on 01/20/2021 at 1430. At 1600 Pt developed a wet productive cough with coarse crackles. Pt ate dinner at 5 pm cough persisted. At 18:30 the nurse went to Pt's room to give him his medications. Pt still had a cough, denied shortness of breath. Pt was in a good mood and joking with staff. Pt asked to be shaved. At 19:45 Pt was sitting in the lounge and a CNA noticed that Pt was pale/white in color and clammy. 02 Sat was 85%. Respirations were labored. Pt was placed on 4 L of 02. Increased to 5 L via face mask and 02 sat was 89-90%. Ambulance was called at unknown time. Pt arrived at Medical Center at 2120 and was pronounced dead at 2127.

No prior vaccinations for this event.

	PRODUCTIVE COUGH	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident expired on 2/5/21 at 03:35pm, about 25 hours after second dose of vaccine. At breakfast, resident was spitting a lot of secretions, coughing up liquids from nose and phlegm, facial swelling, which were all symptoms that he was struggling with prior to both doses of COVID vaccine, but had increased more than prior incidences on 2/5/21. Gurgling noted in upper airways, hyscolamine given, bath given to loosen secretions, morphine given. Family notified and came into facility for compassionate care visit around 1300. 1400 HR was 3 and RR was 2, but increased back to 60 and 12 within 20 minutes. Then resident expired at 1535.		No prior vaccinations for this event.
	PRODUCTIVE COUGH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Called PCP, from the note: I got my shot on Jan 19. But last Friday I have been down with a horrible flu. I'm wearing diapers because of uncontrollable diarrhea. I can't leave my sofa to walk over to my desk because I'll be so out of breath. I have a cough that produces a pink or gold Phelm I have dry mouth. I have no appetite I'm so weak and have lost 15 pounds. Don't know what to do. My next Covid is shot is feb 11 Called employer on 2/3/21 but hung up. Tried calling multiple times to follow up. In triage she stated she had a COVID test scheduled and had spoken with her PCP. COVID test through PCP: 2/4/21 She passed away the night of 2/4/21		No prior vaccinations for this event.
	PRODUCTIVE COUGH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19		No prior vaccinations for

on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back

this event.

to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

PROTEIN TOTAL	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"	No prior vaccinations for this event.

PROTEIN TOTAL	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21	No prior vaccinations for

reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	this event.
PROTEIN TOTAL DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass	No prior vaccinations for this event.

away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of	No prior vaccinations

chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o

No prior vaccinations

some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. PSYCHOMOTOR HYPERACTIVITY

COVID19 (COVID19 (MODERNA)) (1201)

Patient had the first Moderna Covid vaccine on Thursday 1/21/2021. She had a bit of sore arm on that day and the day after. On Saturday 1/23/2021, she had a fever of 100.5 F (11AM), nausea, light headache and chills. The temperature went down after she took ibuprofen. Patient's husband enrolled her to V-Safe to report all the adverse effects she experienced. On Sunday 1/24/2021, her temperature was 98.3F. She still had nausea and no appetite. She and her husband watched a football game in their bedroom upstairs. Husband noticed that his wife was pacing around the room many times. At 7Pm, Husband went downstairs for dinner but she refused to come down to eat. He went upstairs around 8pm, TV was still on. He turned off TV and went down stairs again thinking his wife felt as sleep while watching TV. He went back upstairs for bed around 10:30 PM. Husband said his wife had a deviated septum so she would snore very loudly when asleep.

No prior vaccinations for this event.

He didn?t hear her snoring so he went to check on her and found her not responsive. Husband called emergency services. Paramedic came at 10:45 and said patient was passed. Husband sent many texts to V-safe after that to report the incident. No response was received from V-safe. Patient?s doctor told her husband that she died due to cardiac arrest.

PULMONARY CONGESTION

COVID19 (COVID19 (MODERNA)) (1201)

Died; Increased respirations (22 and labored at times); Pulse 105; 94% O2 on RA; Labored breathing at times; leukocytosis; elevated BUN; left lower lung congestion; elevated creatinine; Temperature of 102.0F; Redness on face; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced redness on face, increased respirations, labored breathing at times, temperature of 102F, pulse of 105, 94 percent O2, leukocytosis, elevated BUN, left lower lung congestion, elevated creatinine, and death. The patient's medical history, as provided by the reporter, included dementia and reduced mobility. No relevant concomitant medications were reported. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient began to experience redness on her face, increased respirations (reported as 22 and labored at times), pulse of 105, and 94 percent oxygen saturation on room air. The patient had a fever of 102 degrees Fahrenheit. Laboratory tests revealed a negative influenza swab, elevated white blood cell count of 14.1, elevated BUN at 113, and creatinine 2.7. Chest x-ray showed mild, left lower lung infiltrate. On 31 Dec 2020, the patient went under hospice care per her family request.. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2021, the cause of death was unknown.; Reporter's Comments: This case concerns a 92-year-old, female subject with medical history of dementia and reduced mobility, who experienced the serious unexpected events of death, respiratory rate increased, heart rate increased, oxygen saturation decreased, elevated BUN, elevated creatinine, left lung congestion and dyspnoea and the non-serious events of erythema and pyrexia. The events of respiratory rate increased, heart rate increased, oxygen saturation decreased, dyspnoea, erythema and pyrexia

PULMONARY EMBOLISM

COVID19 (COVID19 (MODERNA)) (1201)

"Patient called EMS approximately 1pm on 2/15 with complaints of generalized weakness. Upon arrival EMS found her to be diaphoretic and she had a witnessed syncopal episode with question of v-fib and seizures. She became unresponsive and had no pulse. CPR was begun and she was transported to ED. She remained asystole throughout. CPR was initially continued in the ED for approximately 30 minutes and then stopped with Time of Death noted at 13:27. ED notes noted ""suspect given history that patient experienced massive	No prior vaccinations for this event.

MI, PE or ruptured AAA"". Death certificate notes indicate ""signficant conditions contributing to death after cardiac arrest; ASCVD""."

PULMONARY EMBOLISM

COVID19 (COVID19 (MODERNA)) (1201)

Vaccine was administered 2/1/2021 at approximately 9am. Due to self reporting of allergic reaction (hives) to Augmentin, patient was monitored on site for 30 minutes. After the monitoring period, she was cleared to go with no issues reported at the time. We were later informed that the patient passed away from a pulmonary embolism on 2/12/2021.

No prior vaccinations for this event.

PULMONARY EMBOLISM

COVID19 (COVID19 (MODERNA)) (1201)

9 days after vaccination, the patient was found deceased in his home, sitting on his couch. Determined to be due to pulmonary embolism.

No prior vaccinations for this event.

PULMONARY EMBOLISM

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient reported to Emergency room on 01/23/2021 with complaint of nausea. According to ER record patient reported he received a COVID 19 vaccine Pfizer the day before. Work up in the ER (CT ABD PELVIS) reveal a clotted of SMA. CT CHEST REVEALED BILATERAL PULMONARY EMBOLUS. THE PATIENT WAS TRANSFERRED TO THE STATE HOSPITAL. HE WAS SCHEDULED FOR EMERGENT VASCULAR SURGERY WHICH WAS CANCELLED AS THE PATIENT DIED SHORTLY AFTER HIS ARRIVAL.

No prior vaccinations for this event.

PULMONARY EMBOLISM

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
Pt develops left leg pain The day after vaccination in AM subsequently drove approximately 150 miles On his way back stopped at his brothers place for lunch. He then collapsed coning down the steps, EMS started CPR. took him to ER Resuscitated briefly but went into CardioPulm Arrest again and PEA Resucitaion for aprox 1 hour but was unsuccessful. Noted to have Left leg more swollen than Right by 3 to 4 CM presumed to have died from massive Pulmonary embolism and inferior wall myocardial ischemia	No prior vaccinations for this event.
PULMONARY EMBOLISM	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
DEATH Narrative: Pt he reports he developed chills SOB body aches the same night as receiving the COVID vaccine on 1.26.2021-pt is currently reporting CheSt tightness and SOB Admitted to hosp: ICU with Bilateral Pulmonary Emboli, LLE DVT, NSTEMI, Arrhythmia.	No prior vaccinations for this event.
PULMONARY EMBOLISM	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left	No prior vaccinations for this event.

ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first

dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

PULMONARY FIBROSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was	No prior vaccinations for this event.

admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

PULMONARY GRANULOMA

COVID19 (COVID19 (MODERNA)) (1201)

started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.

	PULMONARY OEDEMA	**COVID19 (COVID19 (MODERNA)) (1201)**
At approximately, 1855, I was alerted by caregiver, resident was not responding. Per caregiver, she was doing her rounds and found resident in bed, unresponsive, mouth open, observed gurgling noises and tongue hanging out of mouth. This primary caregiver observed resident at baseline and ambulating after dinner at approximately, 1800 less than an hour prior to incident. This PCG called 911 for EMS and gave report of incident. Resident was taken to Medical Center Emergency Department. At ER, CT scan and X-ray was performed. Per report from ER RN, CT scan and x-ray revealed an intracranial aneurysm and fluid in the lungs. Per RN, resident was still unresponsive and was admitted to Medical Center for observation and comfort measures. This primary caregiver reported to RN, resident recently received the first dose of COVID-19 vaccine on 1/2/21. Primary caregiver received a call from Castle RN at 0700, resident expired at 0615.		No prior vaccinations for this event.

ER notes reveal a syncopal episode in the shower prior to collapse at prompt care. Central line placed and plan to ship to another facility, patient continued to decline despite dopamine and dobutamine expired in ER prior to transfer.		No prior vaccinations for this event.

	PULMONARY OEDEMA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some		No prior vaccinations for this event.

interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with

radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

PULMONARY OEDEMA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
pulmonary edema; Low heart rate; chest pain; This is a spontaneous report from a contactable pharmacist. An 80-years-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left arm on 28Jan2021 at single dose for COVID-19 Immunisation. Medical history included dementia, high blood pressure, COVID prior vaccination. He had no known allergies. Concomitant medication included diltiazem hydrochloride (CARDIZEM), anastrozole (ARIMIDEX), simvastatin and lorazepam. Historical Vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 07Jan2021 (at the age of 80-years-old) at single dose for COVID-19 Immunization. There was no other vaccine received in four weeks. The patient experienced pulmonary edema, low heart rate and chest pain on 26Feb2021. The events resulted in hospitalization and patient died. The patient was hospitalized from 26Feb2021 for 1 day. Treatment received for the events included Epinephrine, morphine, nitroglycerine. The patient underwent lab tests and procedures which included Covid test Nasal Swab post vaccination on 26Feb2021 indicated Negative. The patient died on 26Feb2021. An autopsy was not performed. information on the lot/batch number has been requested.; Sender's Comments: Pulmonary edema, low heart rate, and chest pain, all reported as fatal, are deemed unrelated to BNT162B2 vaccine, being rather accidental occurrences, likely favored by the patient's age and by the mentioned high blood pressure, known risk factor for cardiovascular diseases. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Low heart rate; pulmonary edema; chest pain		No prior vaccinations for this event.

"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An 85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19 immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if	No prior vaccinations for this event.

ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything, nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30 (on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just

wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart stopped"

"Myocardial infarction Narrative: PMH significant for aortic valve stenosis, mitral valve stenosis, CKD, CHF, DM, HTN, obesity, hypothyroidism and dyslipidemia. Per report from primary care - the patients wife reports that the patient went on Saturday (1/30/21 - about 1050) morning to receive his COVID vaccine. He returned home and told her about the experience and denied any side effects. He then proceeded to sit in his easy chair for a while and around 1:30, she asked him if he wanted any lunch. The patient's wife reports he ""grumbled"" at her, and then got up to go to the bathroom. She then heard a loud crash and found him lying on the floor of the bathroom, with his head knocking hole in the wall as he fell. She could not detect a pulse. She called 911 and began compressions. First responders to the scene likewise tried to revive him but were not successful in her efforts. Per primary care documentation - Uncertain if related to Pfizer vaccine; vaccine administered on 1/30/21 and approximately 3 hours later suffered fatal MI at home." "Patient expired. Per Emergency MD note: ""This is a 72-year-old male with what sounds like diabetes, atrial fibrillation, and hypertension who presents via EMS in cardiac arrest. It sounds like he received his		No prior vaccinations for this event.

Covid vaccine last week. Initially he had some mild effects from it. However over the last day or so he has felt very unwell. He apparently called his wife today and told her that he was not feeling well and so she returned home. Shortly thereafter he attempted to get up from his chair. He then collapsed and fell forward onto his face. Sounds like his wife had some difficulty rolling him over to perform CPR. When EMS arrived they found him in PEA. He received a total of 5 rounds of epinephrine. At some point they did have return of spontaneous circulation. However just prior to arriving in the emergency department they lost pulses again. The patient was intubated with an 8 oh endotracheal tube prior to arrival."""

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care	No prior vaccinations for this event.

center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

	2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids	No prior vaccinations for this event.

were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. a bit ""like coming out of a deep sleep per son, around 10 pm. Shortly after that patient was having a hard time breathing. Emergency called. Arrested around the time EMS arrived. King airway, I/O and CPR initiated. Patient has been in v fib. Was shocked multiple times, given 4 rounds of epi, bicarb and amiodarone. ACLS continued on arrival. Multiple rounds of epi, and attempted defib. Patient given epi, bicarb. Rhythms included fine v fib, asystole, and PEA. Unrecoverable with no cardiac motion. Time of death 11:50 pm."

	PULSELESS ELECTRICAL ACTIVITY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Per EMS, the patient was last seen walking and talking to wife 10 minutes prior to EMS arrival. EMS reports via patients wife, that patient was upstairs to change for his doctor appointment then patient's wife found him down. The patient received his COVID-19 vaccine on 1/25/21. EMS states they gave 5 rounds of EPI then patient moved into vfib then was shocked once but returned to asystole. In ED, the patient initially in asystole CPR was started immediately. The patient was given 3 rounds EPI, 1 round bicarb. The patient stayed in PEA throughout. Patient was given tPA. Patient continued to be in asystole and time of death was called at 11:35 am.		No prior vaccinations for this event.

	PULSELESS ELECTRICAL ACTIVITY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds.		No prior vaccinations for this event.

Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

PULSELESS ELECTRICAL ACTIVITY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

"Patient expired. Per Emergency MD note: ""This is a 72-year-old male with what sounds like diabetes, atrial fibrillation, and hypertension who presents via EMS in cardiac arrest. It sounds like he received his Covid vaccine last week. Initially he had some mild effects from it. However over the last day or so he has felt very unwell. He apparently called his wife today and told her that he was not feeling well and so she returned home. Shortly thereafter he attempted to get up from his chair. He then collapsed and fell forward onto his face. Sounds like his wife had some difficulty rolling him over to perform CPR. When EMS arrived they found him in PEA. He received a total of 5 rounds of epinephrine. At some point they did have return of spontaneous circulation. However just prior to arriving in the emergency department they lost pulses again. The patient was intubated with an 8 oh endotracheal tube prior to arrival."""

PULSELESS ELECTRICAL ACTIVITY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he

No prior vaccinations for this event.

collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.

PYREXIA		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient obtained initial dose of Moderna vaccine on Thurday, Jan 14. No adverse effects reported during initial 15 minute post vaccine waiting period. Saturday morning (Jan 16), patient developed severe cough, labored breathing, and fever. Additionally patient mental status changed suddenly, became non-communicative (unable to speak, but would scream if she was touched). O2 status was irregular, dropping to 78. mRNA-1273 (lot number 037k20a) for COVID-19 infection prophylaxis. On an unknown date in Jan 2021, some time after receiving the vaccine, the patient was feeling feverish with body aches and loss of appetite. On 09 Jan 2021 at approximately 21:30, the patient was found dead at home slumped on the floor. According to the paramedics, the patient was dead longer than when his wife found him, and no resuscitation was performed. Action taken with mRNA-1273 in response to the events was not applicable. The outcome of the events, feverish, body aches, loss of appetite, was considered resolved. The patient died on 09 Jan 2021. The cause of death was not reported. The reporter assessed the event, death, as not related to Moderna's COVID-19 Vaccine. The reporter did not provide assessment for the events, feverish and body aches, in relation to Moderna's COVID-19 Vaccine.; Reporter's Comments: This case concerns a 65 year old male patient with medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia, who experienced the serious unexpected event of death, non-serious unexpected event of loss of appetite, and non-serious expected events of fever and body pain. The event of death occurred 5 days after the first dose of mRNA-1273. The events of fever, body pain and loss of appetite occurred an unspecified period of time after the first dose of mRNA-1273. Very limited information regarding these events has been provided at this time. Based on temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Definitive causal association is confounded by age and medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia.

Patient received Moderna COVID vaccine on 12/30/2020 at a Pharmacy clinic where he was a resident. Nurses at the facility reported that he was responsive and showed no signs of any adverse effects until 1/2/2021 when he was observed slightly unresponsive and staring at the ceiling and trembling. He had a fever of 101F at this time. The facility ordered labs and a rapid COVID test (all of which came back normal) and started IV antibiotics. A few hours later, patient began bleeding from his eyes, nose, and mouth and was sent to the local ER. The patient refused being admitted to the ICU for possible sepsis/hemorrhage and died the following day on 1/3/2021. All healthcare professionals involved agreed that this was not likely due to the vaccine, but needed to be reported nonetheless.	No prior vaccinations for this event.

COVID19 (COVID19 (MODERNA)) (1201)

She had pain in the injection site Tuesday night and then during Tuesday she got worse with nausea and some fever. By Wednesday she was complaining that she could not pee even though she was drinking a lot of fluids. She continued to complain it was the worst she ever felt and then at 0600 Thursday morning she woke us up and said she needed to go to the hospital. We arrived at the hospital just before 0700 and she immediately threw up in the trash can. We went into a treatment room and they took blood and started fluids as she became incoherent. She said she had taken Tylenol so they started a drug to counter that but her liver function was all wrong and they started to look for a hospital that could transplant a liver. She was air evade about 0930 to Medical center and just over 30 hours latter she was dead. There is a pending autopsy. She was a healthy 39 year old mother who got the shots because she worked as a surgical tech and she was the single mother of a 9 year old little girl.

No prior vaccinations for this event.

Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be		No prior vaccinations for this event.

the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.		
	PYREXIA	**COVID19 (COVID19 (MODERNA)) (1201)**
According to patient's caregiver, patient presented with symptoms of fever (101.6 F) and purple blotches all over the body within an hour. Since patient was in hospice , caregiver called Hospice and a pharmacy and was told to give patient Benadryl and Tylenol. Patient was given both medications and the fever subsided in a few days but the purple blotches never went away. Patient passed away at the facility a week later. 	PYREXIA	**COVID19 (COVID19 (MODERNA)) (1201)**
On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.	No prior vaccinations for this event.	

	PYREXIA	**COVID19 (COVID19 (MODERNA)) (1201)**
	High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased; Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. 	loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt	No prior vaccinations

subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.	for this event.

COVID-19; COVID-19; Pneumonia; respiratory failure; This is a spontaneous report from a contactable consumer. An 80-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 02Jan2021 for COVID-19 immunization. Medical history included Alzheimer's and others. No known allergies. Concomitant medications included unspecified medications. The reporter's mother in law was tested for COVID-19 at a nursing facility on 25Dec2020 and she was negative. On 02Jan2021, she received the first dose of Pfizer vaccine. On 04Jan2020, she developed a high fever, needed oxygen and was positive for COVID-19. Date of death was 04Jan2021. The cause of her death was listed as pneumonia, respiratory failure and COVID-19. No autopsy performed. No treatment received. No one knew if the vaccination contributed to her death. It was hard to know if her death was due to the administration of the vaccine or it exacerbated the COVID19 symptoms which led to her death. Since this was unknown, it could have been a possibility. The reporter wanted to give us this information because we might want to consider having high risk population, patients with underlying conditions, older population tested for COVID-19 prior to the vaccination, as this is not currently a recommendation or a requirement. All is very new and they are all learning so the reporter wanted to share this information with us. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There are medications the patient received within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The outcome of the events was fatal. Information about Lot/Batch has been requested.; Sender's Comments: The association between the fatal event lack of effect (pneumonia, respiratory failure and		No prior vaccinations for this event.

COVID-19) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. 	Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature	No prior vaccinations for this event.

was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his

cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from nursing home staff report.	No prior vaccinations for this event.

effusion on 21Feb2021 14:15, fever on 13Feb2021, headache on 13Feb2021, stomach upset on 13Feb2021, on 19feb, he began to feel ill again with a fever, he felt worse on 20feb on 19Feb2021, on 21feb he went to the ER after vomiting and passing out on 21Feb2021. Events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of cardiac arrest due to pericardial effusion. Course of events: In Feb2021, 10 days after his 1st injection, the patient developed fever, headache, and stomach upset. He went for a rapid Covid-19 test (nasal swab) and it was negative on 11Feb2021. The doctor told him he might be having a delayed reaction to the vaccination. After a couple of days, he improved. On 19Feb2021, he began to feel ill again with a fever. He felt worse on 20Feb2021. On 21Feb2021 he went to the ER after vomiting and passing out and received treatment: IV fluids, diagnostic testing at ER. Rapid Covid test (nasal swab) at ER came back negative again on 21Feb2021. His heart arrested suddenly and he could not be resuscitated. CT scan results, that came back after death, showed Covid like pneumonia and pericardial effusion. The patient died on 21Feb2021 14:15. Cause of death was cardiac arrest due to pericardial effusion. An autopsy was not performed. The outcome of cardiac arrest due to pericardial effusion was fatal, of fever, headache, stomach upset was recovering, of he began to feel ill again with a fever, he felt worse was not recovered, of he went to the ER after vomiting and passing out was unknown.; Reported Cause(s) of Death: cardiac arrest due to pericardial effusion; cardiac arrest due to pericardial effusion

PYREXIA

COVID19 (COVID19 (UNKNOWN)) (1202)

Patient was admitted to hospital from home in cardiac arrest. Hx of hypertension, hyperlipidemia, type 2 diabetes (not on insulin) and bilateral carotid artery stenosis. The patient was reportedly at his baseline health on 2/2/21. He received the 2nd dose of COVID vaccine around 1000AM on 2/2/21. Reportedly started running fever of 100.1 and chills the afternoon of 2/2/21. Around 7:00PM he started having dry cough and was complaining of breathing difficulties. He subsequently vomited multiple times (was eating pizza and aspirated) then lost consciousness. His wife called 911, did CPR and EMS reported he in PEA at scene and was intubated. Transported to hospital. SARS CoV-2 and influenza negative.

No prior vaccinations for this event.

	RADIAL PULSE ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
loss of consciousness Narrative: Patient received COVID-19 vaccine dose #1 on 1/6/21 w/o complications. Per 1/6/21- 1/9/21 nursing notes, patient did not experience any injection site reactions, denied pain or tenderness at injection site, no dizziness, no n/v, remained afebrile. Around 1/9/21 @1810, patient became acutely nonresponsive after being helped to the edge of bed. Per nurses, he was previously awake/alert, talking and asymptomatic. Patient is DNR/DNI but facility rapid response emergency team called d/t patient's sudden change of condition. Emergency team helped patient into lying position. Per 1/9/21 ICU emergency team note, patient appeared comfortable w/ no palpable radial pulse and had minimal shallow agonal breathing. Pulse ox 94%, HR in 60s per machine. BP unmeasurably low by BP cuffx3. Resident passed at 18:20 pm.		No prior vaccinations for this event.
	RADIOTHERAPY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin,		No prior vaccinations for this event.

LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on

imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

RALES

COVID19 (COVID19 (MODERNA)) (1201)

RALES	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was	No prior vaccinations for this event.

made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.
RED BLOOD CELL COUNT DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.	No prior vaccinations for this event.
RED BLOOD CELL COUNT DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level.	No prior vaccinations for this event.

Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.

RED BLOOD CELL COUNT DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.	No prior vaccinations for this event.
RED BLOOD CELL COUNT DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021	No prior vaccinations for this event.

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious,	No prior vaccinations for this event.

but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note,

No prior vaccinations for this event.

PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard

of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

RED BLOOD CELLS URINE

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep

No prior vaccinations for this event.

his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

RED BLOOD CELLS URINE POSITIVE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

RED CELL DISTRIBUTION WIDTH	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid	No prior vaccinations for this event.

retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.

RED CELL DISTRIBUTION WIDTH INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.

No prior vaccinations for this event.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained.

No prior vaccinations for this event.

He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. Approximately 2 weeks post vaccination developed rapid AF, CHF. Admitted to Medical Center. Discharged home on hospice. Patient died at home on 2/13/2021. Reported to this reporter at second dose clinic on 2/16/21. Other details not known. Unknown if related to vaccine.

No prior vaccinations for this event.

RENAL FAILURE

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done to save his life. He subsequently passed away @ approximately 8:55 am CST on 2/11/21.	No prior vaccinations for this event.
RENAL REPLACEMENT THERAPY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt received vaccine on 7 jan. 2021 Twelve days later, on 19 January 2021, Pt developed symptoms of COVID (cough, sore throat, fever, myalgias), on 20 Jan, pt admitted to hospital for worsening symptoms. Pt tested positive for COVID 19. Pt admitted to ICU where pt had complicated hospital course to include ARDS secondary to COVID pneumonia, nonSTEMI, with biventricular heart failure, on multiple pressor, rhabdomyolysis with acute kidney injury, requiring CRRT. Pt was in hospital for 10 days; he passed away on 31 Jan 2021.	No prior vaccinations for this event.
RENAL TUBULAR NECROSIS	**COVID19 (COVID19 (PFIZER-BIONTECH))**

	(1200)
Approximately 2 weeks post vaccination developed rapid AF, CHF. Admitted to Medical Center. Discharged home on hospice. Patient died at home on 2/13/2021. Reported to this reporter at second dose clinic on 2/16/21. Other details not known. Unknown if related to vaccine.	No prior vaccinations for this event.
RESPIRATION ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
No adverse effects noted after vaccination. Patient with cardiac history was found unresponsive at 16:45 on 1/6/21. Abnormal breathing patterns, eyes partially closed SPO2 was 41%, pulseless with no cardiac sounds upon auscultation. CPR and pulse was regained and patient was breathing. Patient sent to Hospital ER were she remained in an unstable condition had multiple cardiac arrest and severe bradycardia and in the end the hospital was unable to bring her back.	No prior vaccinations for this event.
RESPIRATION ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
"On 1/15/2021 at 1800, resident noted to be lethargic and shaking, stating ""I don't care."" repeatedly. C/O head and neck pain. T100.6. Given Tylenol with no relief of pain. Order received for Aleve and administered.. Assisted to bed as usual in evening. Monitored during night shift and noted to be resting comfortably/sleeping.. Noted agonal breathing at 4:10 AM 1/16/2021 , T 99.4, Absence of vital signs at 4:15AM 1/16/21 and death pronounced at 4:40AM 1/16/21."	No prior vaccinations for this event.
RESPIRATION ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Two days later passed away; difficulty breathing, shortness of breath; difficulty breathing, gurgling; Not feeling well; Achiness; Severe fever; Chills; A spontaneous report was received from a physician concerning a 56-	No prior vaccinations

year-old female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed fever, chills, achiness, shortness of breath, gurgling and unresponsive. The patient's medical history was not provided. Concomitant product use was not provided. On 19 Jan 2021, prior to the onset of the events, the patient received their second of two planned doses of mRNA-1273 (Lot 042L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. After receiving the vaccine on 19 Jan 2021, the patient experienced fever, chills, shortness of breath, gurgling and achiness. On 21 Jan 2021, the patient was found unresponsive. Emergency medical services were called to perform life saving measures however, they were unsuccessful. No further treatment information was provided. The patient died on 21 Jan 2021. The cause of death was reported as unknown. An autopsy was planned.; Reporter's Comments: This case concerns a 56-year-old, female, who experienced a serious event of death, with many other events after receiving second dose of mRNA-1273 (Lot# 042L20A). Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death		for this event.
	RESPIRATION ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.		No prior vaccinations for this event.
	RESPIRATION ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.	No prior vaccinations for this event.

RESPIRATION ABNORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
Hx dementia, CVA, CAD. 2-3 year history of only consuming 25% of 1-2 meals daily. All meds d/c early 2020 because of refusing to eat or drink anything. Suddenly began drinking april/may, gained weight back. Vaccinated on 1/7/21 & 2/4/21. On 2/22/21 had significant changes in respiratory status. Passed away 2/23/21.		No prior vaccinations for this event.
RESPIRATION ABNORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
All residents had been in isolation due to multiple cases of COVID in the facility. Resident voiced no health related complaints. He continued to visit with staff and required moderate assist with toileting. Resident had fall 0130 on 1-15-2021, which resulted in laceration with surgical repair. Resident was noted to change in mental status and respirations on morning of 1-16-2021 during morning blood sugar check. Resident had O2 @1.5l/m via n/c and respirations of 10 with periods of apnea and unresponsive to verbal stimuli. Blood sugar was 583. Resident deceased upon re-check after calling PCP to report status change.		No prior vaccinations for this event.

73-year-old man s/p first dose of Pfizer at 10:20 AM Ambulated comfortably to exit after 20 minutes in observation but 10:45 collapsed while exiting the building 10:47 CPR initiated 10:49 medical team/EMS found no pulse, agonal respirations, ventricular fibrillation Paramedics and team performed ACLS; of note patient was intubated 7.5 ETT with bilateral breath sounds on ventilation; paramedic reported easy intubation with no apparent throat swelling; 11:02 transported to Emergency Department 11:30 Pronounced		No prior vaccinations for this event.

dead at Emergency Department

RESPIRATORY ACIDOSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was was brought to the ED from facility which he received the vaccine via ambulance with BiPAP, hypoxia, and one dose of Epi of 0.3 mg. He then required intubation, and had struggled with hypoxia, even on increasing PEEP. CODE BLUE called in the ED for PEA. He was medicated for such (please see the code run sheet for details), and he came in and out of the code 5 times. After 95 minutes, with the wife at the bedside, and family conference by phone, the code was called, and he was pronounced at 18:20. He received in total 8 me of Epi, 3 shots of Atropine, 3 amps bicarb. He got lasix 40 mg, lovenox 60 mg subcutaneous once. He had a CVC into the right internal jugular, and levophed was started, then Epinephrine drip was started. Prior to the code he got steroids (solumedrol 125 mg, then later decadron 6 mg iv), benadryl iv, antibiotics (ceftraixone / zithromax), and lasix 40 mg. All this time while in the ED, the Rt was at the bedside, and lots of secretions from the lungs were aspirated, bloody color. á Code was the result of PEA secondary to hypoxia (	No prior vaccinations for this event.

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or		No prior vaccinations for this event.

lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board

for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt suffered Cardiac Arrest and respiratory arrest on 2/9/21 and passed away at a local hospital. He had multiple health conditions likely contributing to this. he arrested at home and CPR was attempted and unsuccessful. Pt received his Covid vaccine #1 on 1/27/21. No issues were noted after vaccine and was due for his 2nd dose next week. However, we were notified he passed away on 2/9/21. Very likely death not at all related to vaccine but wanted to document as patient was in the middle of the covid vaccine series.	No prior vaccinations for this event.
RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was coded and expired Code Blue: Patient was in dialysis, after 30 minutes his sbp dropped to 60s he was given 4 albumin. Patient who was responsive before that became unresponsive, had seizure like activity, lost pulse and spontaneous breathing. HD stopped. Code called. Cpr started. A few minutes into cpr patient started to profusely bleed - gi bleed and ventilation became very hard., intubation was very difficult and ventilation hard as we suctioned large amounts of aspirated blood. Patient was eventually intubated. More than 8 doses of epi ws given, sodium bicarbonate * 2 given with continuous cpr. It was mostly PEA with one shockable rhythym. And shock delivered for vfib. patient continued to profusely bleed, og insertion was not successful and effective ventilation was very tough due to massive aspiration,. Possible variceal rupture with cpr from his cirrhosis is likely scenario. After 30 minutes of unsuccessful	No prior vaccinations for this event.

ventilation and acls protocol. Code was stopped.

	RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done to save his life. He subsequently passed away @ approximately 8:55 am CST on 2/11/21.		No prior vaccinations for this event.

2/7/21 Increased difficulty chewing, swallowing, evaluated by SLP and dietician. Diet texture down-graded x 2 with poor appetite and recent 6lb weight loss. 2/8/21-APRN updated regarding poor appetite and difficulty chewing as well as downgraded texture of diet. Also informed of increased s/s of discomfort and increased use of PRN Oxycodone for pain. 2/9/21- elevated temp 100.7. 2/9/21 Covid pcr test negative. 2/9/21-N.O.?s APRN BMP, Albumin and Pre-albumin Level in am. 2/11/21-elevated temp 100.4. Covid rapid test negative.		No prior vaccinations for this event.

2/12/21- CBG recorded at 517 at 5:20 am. Resident also has an elevated temp of 100.9. Tylenol administered per order. Vital signs include resp 24, radial pulse 134, O2 sat 83%. Supplemental oxygen administered via nasal cannula. Head of bed elevated. DR. notified at time via telephone. Order given for sliding scale for CBG. Guardian updated regarding changes in residents condition, poor prognosis. Guardian requests Hospice eval and admit. Guardian requests comfort care no hospitalization, no IV's, no G-tubes, no labs etc, D/C of Palliative services. ARNP informed. 2/12/21 Acute Telehealth visit with APRN due to increased lethargy, elevated CBG?s despite poor appetite and insulin administration. Resident unresponsive to verbal and noxious stimuli at time of visit. N.O. Morphine sulfate 20mg/ml, give 2.5mg PO/SL Q4hr PRN pain/shortness of breath. 2/12/2021-Admitted to Hospice, Lethargic, diaphoretic, T 98.1 P 130's R 18 O2 high 80's to low 90's via O2 mask at 3L. 2/12/2021- Resident legs and arms noted to feel cool this afternoon, 02 sat was 97% with 02 on @ 3L with mask Noted resident with sob and increased pulse. Prn morphine 0.25ml sl. given with good effect. Resident was less restless and quiet in her bed. Checked on resident several times this shift for needs. Resident noted to not move in her bed @ 8:15pm and noted she was not breathing. Supervisor called and pronounced resident deceased.

RESPIRATORY ARREST

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

02/07/21 through 2/13/21 slightly fatiqued, took all his prescribed medications, ate breakfast, lunch and dinner was drinking eight 10 oz bottles of water. On 02/14/21 was very tired had a difficult time breathing after taking the normal meds. He took a breathing treatment with his prescribed Ipratropium Bromide and Albuterol Sulfate via home nebulizer. This did not improve his breathing. He was very weak and breathing was labored. 911 was called by wife. 911EMTchecked pulse and breathing. Informed him they would give him a breathing treatment.He started to go limp. EMT's got him to Ambulance and to Medical Center to the ER. Heroics done. He died. Pulmonary and Cardiac Arrest

No prior vaccinations for this event.

RESPIRATORY ARREST

COVID19 (COVID19

		(PFIZER-BIONTECH)) (1200)
Unable to breathe and died. Doctors unable to save her upon arrival No prior vaccinations for this event.		
RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**	
The recipient was feeling well immediately after the vaccination, all day on 2.8 and in the morning of 2.9. His daughter in law text him at 0930 and he did not respond to the text (atypical) and then he missed a morning meeting. His wife was downstairs in a meeting herself and after the meeting was over she called to him and he did not respond. She found him with no pulse and was not breathing. She called 911 and attempted CPR. They did not complete an autopsy, they stated that they believe the cause of death was either an embolism, Heart attack or aneurism. The wife stated that she does not believe the death was due to the vaccination; however, there were no tests completed to prove or disprove.		No prior vaccinations for this event.
RESPIRATORY ARREST		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Minor arm pain on 2nd day of each vaccine Diarrhea 3 days after 2nd vaccine Massive heart attack (left ventricle) 8 days (2/24/21) after vaccine Home hospice 3:30pm 2/24/21 Stopped breathing 5:45 am, pronounced dead at 8:22 am on 2/25/21		No prior vaccinations for this event.
RESPIRATORY ARREST		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Pt received 2nd Pfizer BioNTech Covid 19 EUA vaccine @1:50 pm; Pt released from Observation @2:09 pm. Approximately 2:18 pm RN called to parking lot and observed pt having difficulties. Called for EMS &		No prior vaccinations for

crash cart. Vitals taken 2:20 BP 83/55, no respirations noted, pt unresponsive. AED attached. EMS arrived 2:22 and took over care of pt. and transported @2:40 pm to Hospital. Per wife, pt has history of PE in Oct. 2020, HTN, diabetes with insulin pump, obesity, gastroparesis, home oxygen and uses motorized scooter. Wife also said pt had allergy to iodine not previously reported, and MD had stopped Zarelto subsequent to 1st Pfizer vaccine 2/8/21 ""due to breathing difficulty"". Patient was unable to be resuscitated. Time of death 14:59."	this event.
RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2	No prior vaccinations for this event.

high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good

recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Expired within 30days of vaccination. Received vaccine 1/22/21 did not have any complaints, during a bed check she was found on the floor with no apparent injury, no pulse or respirations.	No prior vaccinations for this event.

Fever, RespDepression & COVID positive REMDESIVIR (EUA) 200 mg x1 then 100 mg daily	No prior vaccinations for this event.
RESPIRATORY DEPRESSION	**COVID19 (COVID19 (MODERNA)) (1201)**
Narrative: Patient experienced cardiac arrest with PEA and a witnessed collapse upon arrival to the emergency department on 1/24/21. Patient received his first dose of the COVID vaccine on 01/15/2021and felt poorly thereafter. He was describing shortness of breath to his wife and requiring 5L of O2 at home to maintain saturations in 80s, while he usually was on 3L to maintain saturations in the mid 90s. He had been oriented but more fatigued than normal and described bilateral shoulder pain (which was not new for him) as well as indigestion. Took Tylenol with some relief. He had decreased PO intake and less appetite. The patient's wife encouraged him to come to the hospital daily for a week prior to admission, but the patient did not want to because he felt his side effects were secondary to the vaccine. Symptoms:RespDepression, Palpitations, Syncope & cardiac arrest Treatment: EPINEPHRINE 1 MG ONCE 3 rounds given ,CALCIUM	No prior vaccinations for this event.

CHLORIDE 1000 MG ONCE

	RESPIRATORY DEPRESSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received first dose of the COVID-19 Moderna vaccine on 1/19/2021 at an outside facility (no lot #, route, or site available to me in electronic charting). Pt began having hypoxia, SOB, and a dusky appearance of extremities on 1/29/2021 and was brought by EMS to our hospital. PT is a DNR and family had been looking into a hospice sign up due to dementia and general decline in the weeks prior to hospitalization. Pt tested positive on admission for COVID-19 via PCR test on 1/29/2021. Pt continued to have respiratory decline, was put on comfort care per wishes of family/advanced directives, and he passed away the evening of 1/30.		No prior vaccinations for this event.
	RESPIRATORY DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
began itching within 24 hours, within 5 days couldn't move on her own, by 6th day was having respiratory issues, by day 7 unresponsive, by day 8 dead		No prior vaccinations for this event.
	RESPIRATORY DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt developed COVID-19 infection, symptoms starting 7 days after first dose was given. Patient was admitted to hospital on 1/21 after falling (secondary to weakness) and striking head on toilet. Patient expired due to respiratory complications of COVID on 1/25.		No prior vaccinations for this event.
	RESPIRATORY DISTRESS	**COVID19 (COVID19**

	(MODERNA)) (1201)
36 hours after vaccination, the patient had increased respiratory distress. He was placed on high flow nasal cannula oxygen with mild improvement. He then continued to be hypotensive requiring IV fluids and subsequently IV vasopressors. Patient's BP was stabilized with vasopresor, however he continued to deteriorate clinically with altered mental status and lethargy, concerned for bowel peroration based on physical exam by MD. He was then emergency intubated and placed on mechanical ventilation. He was then transferred to acute care hospital near by.	No prior vaccinations for this event.

Resident passed away unexpectedly on 01/19/21 after developing acute hypoxic respiratory failure on morning of 01/19/21. She was transferred to hospital via EMS where she was intubated, coded, and ultimately expired with uncertain underlying cause, potentially ACS.

No prior vaccinations for this event.

RESPIRATORY FAILURE

COVID19 (COVID19

	(MODERNA)) (1201)
ON 02/08/2021 AROUND 0600 RESIDENTCOMPLAINED OF MOUTH PAIN AND RECEIVED OXYCODONE. DURING THE COURSE OF THE MORNING, RESIDENT EXHIBITED A FEW EPISODES OF LABORED/SHALLOW BREATHING AND SOB AT RESTING. 0XYGEN SATURATION RATE WAS 93-98% ON ROOM AIR, LUNG SOUNDS CLEAR IN ALL LOBES AND PULSE AND TEMPERATURE WITHIN NORMAL RANGE. AS THE DAY PROGRESSED, VITAL SIGNS REMAINED STABLE BUT RESIDENT CONTINUED TO HAVE PERIODS OF SOB/LABORED BREATHING.FAMILY AND NURSE PRACTIONER UPDATED AND THE ORDER WAS RECEIVED TO SEND PATIENT TO MEDICAL CENTER ER FOR EVALUATION PER AMBULANCE. RESIDENT TRANSPORTED AT 1425. RESIDENT RETURNED FROM THE ER AT 1830 ON HOSPICE CARE WITH THE DIAGNOSIS OF: ACURE RESPIRATORY FAILURE WITH HYPOXIA AND END OF LIFE DECISION MAKING. RESIDENT WAS MADE COMFORTABLE AND MONITORED DURING THE NIGHT AND EXPIRED AT 0630 ON 02/09/2021.	No prior vaccinations for this event.
RESPIRATORY FAILURE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient was vaccinated on 1/14/2021. On 1/22/2021, patient tested positive for COVID-19 and admitted to the hospital for acute hypoxemic respiratory failure, COVID-19 pneumonia, and severe ARDS. Patient was intubated on 1/23/2021 and later died on 2/10/2021 after being extubated and placed on comfort measures.	No prior vaccinations for this event.
RESPIRATORY FAILURE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with	No prior vaccinations for this event.

improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

RESPIRATORY FAILURE

COVID19 (COVID19 (MODERNA)) (1201)

death; hemiparesis; respiratory failure; Aphasia; SARS-COV-2 test positive; cough; A spontaneous report was received from other health care professional concerning a 32- year -female patient who received Modena's COVID-19 vaccine (mRNA-1273) and experienced aphasia, cough, death, endotracheal intubation, hemiparesis, respiratory failure and SARS-COV-2 tested positive. The patient's medical history was not provided. No relevant concomitant medications were reported. On 28-Dec-2020, the patient received their first of two planned doses of mRNA-1273 (lot/batch 039k20A) intramuscularly on left arm for prophylaxis of COVID-19 infection. Approximately, one day later, patient developed cough and on treatment with azithromycin for one week. On 03-jan-2021, she experienced left sided weakness and aphasia and was shifted to hospital. Patient was confirmed COVID-19 positive which required intubation for acute hypoxic

No prior vaccinations for this event.

respiratory failure secondary to COVID-19. No laboratory data was provided. Action taken with mRNA-1273 in response to the events aphasia, cough, death, endotracheal intubation, hemiparesis, respiratory failure and SARS-COV-2 tested positive not applicable. On an unknown date, the outcome of the events aphasia, cough, death, endotracheal intubation, hemiparesis, respiratory failure and SARS-COV-2 tested positive was fatal. On 04 Jan 2021, the patient passed away due to the unknown cause. Autopsy results were unknown.; Reporter's Comments: Very limited information regarding this event has been provided at this time. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the event of COVID-19 is assessed as unlikely related. The cause of death was not reported. Autopsy results were unknown.; Reported Cause(s) of Death: Unknown cause of death

RESPIRATORY FAILURE

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen

No prior vaccinations for this event.

levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

RESPIRATORY FAILURE	**COVID19 (COVID19 (MODERNA)) (1201)**
sepsis; respiratory failure; Fever; Unresponsive; A spontaneous report was received from Pfizer concerning a 56-year old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced respiratory failure, sepsis, fever and sudden death. The patient's medical history was not provided. No relevant concomitant medications were reported. On 04 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (lot/batch: unknown) for prophylaxis of COVID-19 infection. On 11 Jan 2021, the patient began to have a fever. She was sent to the emergency room for evaluation. That evening, she died. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 11 Jan 2021. The cause of death was reported as respiratory failure and sepsis. Plans for an autopsy were unknown/not provided.; Reporter's Comments: This is a case of 56-year old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced sepsis, fever, respiratory failure and sudden death. Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Respirtory Failure;	No prior vaccinations for this event.

Sepsis

RESPIRATORY FAILURE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
COVID-19; COVID-19; Pneumonia; respiratory failure; This is a spontaneous report from a contactable consumer. An 80-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 02Jan2021 for COVID-19 immunization. Medical history included Alzheimer's and others. No known allergies. Concomitant medications included unspecified medications. The reporter's mother in law was tested for COVID-19 at a nursing facility on 25Dec2020 and she was negative. On 02Jan2021, she received the first dose of Pfizer vaccine. On 04Jan2020, she developed a high fever, needed oxygen and was positive for COVID-19. Date of death was 04Jan2021. The cause of her death was listed as pneumonia, respiratory failure and COVID-19. No autopsy performed. No treatment received. No one knew if the vaccination contributed to her death. It was hard to know if her death was due to the administration of the vaccine or it exacerbated the COVID19 symptoms which led to her death. Since this was unknown, it could have been a possibility. The reporter wanted to give us this information because we might want to consider having high risk population, patients with underlying conditions, older population tested for COVID-19 prior to the vaccination, as this is not currently a recommendation or a requirement. All is very new and they are all learning so the reporter wanted to share this information with us. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There are medications the patient received within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The outcome of the events was fatal. Information about Lot/Batch has been requested.; Sender's Comments: The association between the fatal event lack of effect (pneumonia, respiratory failure and COVID-19) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well	No prior vaccinations for this event.

as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19

RESPIRATORY FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

RESPIRATORY FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was was brought to the ED from facility which he received the vaccine via ambulance with BiPAP, hypoxia, and one dose of Epi of 0.3 mg. He then required intubation, and had struggled with hypoxia, even on increasing PEEP. CODE BLUE called in the ED for PEA. He was medicated for such (please see the code run sheet for details), and he came in and out of the code 5 times. After 95 minutes, with the wife at the bedside, and family conference by phone, the code was called, and he was pronounced at 18:20. He received in total 8 me of Epi, 3 shots of Atropine, 3 amps bicarb. He got lasix 40 mg, lovenox 60 mg subcutaneous once. He had a CVC into the right internal jugular, and levophed was started, then Epinephrine drip was started. Prior to the code he got steroids (solumedrol 125 mg, then later decadron 6 mg iv), benadryl iv, antibiotics (ceftraixone / zithromax), and lasix 40 mg. All this time while in the ED, the Rt was at the bedside, and lots of secretions from the lungs were aspirated, bloody color. á Code was the result of PEA secondary to hypoxia (	No prior vaccinations for this event.

(1200)

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced

No prior vaccinations for this event.

pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued.

Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

	RESPIRATORY FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

According to medical report, Pt presented to the ED on 1/14/21 w/ cc of SOB for 1 day. She received her COVID-19 vaccine on 1/9/21. Pt stated that she developed a dry hacking cough 2 days prior to the vaccine on 1/7/21. Over the last few days prior to admission, she developed generalized weakness, SOB, loss of sense of taste and smell w/ associated decreased appetite and nausea ultimately SOB in the24 hours prior to admission. Final Diagnosis- acute hypoxic respiratory failure secondary to COVID-19 pneumonia. Pt died on 2/3/21. See Medical report for more information.		No prior vaccinations for this event.

RESPIRATORY FAILURE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"		No prior vaccinations for this event.
RESPIRATORY FAILURE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."	No prior vaccinations for this event.

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.	No prior vaccinations for this event.
RESPIRATORY FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
respiratory failure from COVID19; presented to the ER with COVID symptoms and was diagnosed/died on 09Feb2021 from respiratory failure from COVID19; presented to the ER with COVID symptoms and was diagnosed/died on 09Feb2021 from respiratory failure from COVID19; This is a spontaneous report from a contactable physician. An 89-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in 10Jan2021 at 12:00 at a	No prior vaccinations for this event.

single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had no COVID prior to vaccination. The patient received one dose of Pfizer vaccine on 10Jan2021. The patient was presented to the ER with COVID symptoms and was diagnosed on 27Jan2021. Patient subsequently died on 09Feb2021 from respiratory failure from COVID19. It was unknown if autopsy was done. The patient was tested for COVID post vaccination via nasal swab: covid-19 virus test positive on 27Jan2021. The events resulted in emergency room/department or urgent care, hospitalization, and patient died. No follow-up attempts are possible, information about batch number cannot be obtained. No further information is expected.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported COVID post vaccination and respiratory failure with fatal outcome, and the administration of COVID 19 vaccine, BNT162B2, based on the reasonable temporal association. More information on the underlying medical condition in this 89-year-old male patient is required for the Company to make a more meaningful causality assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021,		No prior vaccinations for this event.

after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

around 6:30am, EMT called time of death"

	RESTLESSNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated	No prior vaccinations for this event.	

ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

When staff went to wake patient apx 0530, he was unresponsive and had no pulse. Chest compressions were started and EMS called.		No prior vaccinations for this event.

RESUSCITATION		**COVID19 (COVID19 (MODERNA)) (1201)**
My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.		No prior vaccinations for this event.
RESUSCITATION		**COVID19 (COVID19 (MODERNA)) (1201)**
"Patient was tested positive for Covid-19 on 12/9/20. Patient received Covid Vaccine on 1/21/21. Patient was observing for 15 minutes in treatment room by Nursing staff. Patient denied any signs/symptoms adverse effect: headache, dizziness & weakness, difficulty breathing, muscle pain, chills, nausea and vomiting, and fever . Patient seated on treatment table appeared to be relaxed, respiration even and unlabored. Health teaching provided. Patient educated to report any changes in condition to staff immediately. Patient verbalized understanding and able to verbalize signs and symptoms and adverse effects to be aware of related vaccine. On 1/22/21: patient was seen by medical provider for ""altered behavior"". Per medical provider's documentation: ""Patient was fallen on 1/2/21 and was sent out to outside hospital on 1/4/21. CT head: no		No prior vaccinations for this event.

intracranial abnormality, age-related changes. Patient had labs (B12, RPR, folate) were within normal limit"". We did MMSE today: 22/30 score ""mild dementia"" On 1/23/20: ""Patient was inside his cell. He was walking towards cell door to obtain his breakfast, when custody witnessed him collapse and activated the alarm. Nursing staff arrived at cell front at 06:34 am and found the patient pulseless and unresponsive, and CPR was immediately initiated. AED was attached at 06:35 am and no shock advised. AMR then arrived and patient did not have ROSC, and was pronounced dead at 06:54 am."""

	RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received his second dose of Moderna COVID vaccine on 2/6 at 12:40PM. Patient was observed for 15 minutes post-vaccination with no adverse events. On the evening of 2/6 (time unknown) the patient began to develop dry cough and fatigue. He was checked by a physician at that time (who was a family member). Patient continued to feel unwell into Sunday. His lungs were clear when checked Sunday afternoon (time unknown). At approximately 5:30pm on 2/7 the patient began experiencing sudden onset shortness of breath. A pulse ox was conducted at that time and it was 92%, and again shortly thereafter and it was 90% (as		No prior vaccinations for this event.

reported by family member). 9-1-1 was contacted at this time. CPR was initiated when he arrived at the emergency department, pulse ox was 60% (as reported by family member). The patient passed away shortly thereafter on 2/8/2021.

RESUSCITATION

COVID19 (COVID19 (MODERNA)) (1201)

Patient found down at home with agonal respirations and per EMS asystole, received 2 rounds of epi at her house with return of spontaneous pulses, lost pulse again in route to ER and another round of epi was given, CPR in progress when arrived at hospital. Prior to this patient's husband states he heard her fall in the bathroom but did not immediately check on her as he states that this has happened before. He checked on her 10 min later and that's when he found her unconscious. Daughter called 911 and she began CPR. No previous complaints of headache, chest pain, back pain, fever or chills. Husband states patient was drinking that evening which is not unusual for her. Patient died at hospital.

No prior vaccinations for this event.

RESUSCITATION

COVID19 (COVID19 (MODERNA)) (1201)

Almost immediate headache per wife. Developed fever around 4 pm. Headache all day. Took Tylenol at 4 and 10 pm. Gradual development of SOB and cough. Temp of 101.4 at 10 pm. pulse ox 92% at 10 pm. Went to sleep, woke up at 0050 with increasing SOB. Pulse ox 82%. Used albuterol inhaler, wife called emergency services at 0113. EMS arrived around 0130 to patient's home. pulse ox 86%, coughing, sob, hard time breathing. Walked to stretcher. Became unresponsive. Found to have no pulse, stopped breathing. CPR initiated at about 0140. King airway placed in field, I/O in left tibia. Patient from PEA to asystole, to vfib, to asystole. ACLS followed. Unrecoverable asystole and patient time of death 0213.

No prior vaccinations for this event.

RESUSCITATION

COVID19 (COVID19 (MODERNA)) (1201)

"02/08/21--2 days after vaccine--Resident stated that she ""didn't feel good"" (She is developmentally delayed and less able to communicate how she feels than those in the community) and stopped eating most foods; also had fatigue. Vitals, coloring, & behavior were normal. 02/09/21--Belly was firm and mildly distended (although she stated it didn't hurt); she coded this evening and CPR was performed before EMT could transport her to the hospital. 02/10/21--Resident passed."	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Received first 1/15/2021 with no adverse reaction. Received 2nd dose 2/9 @ 0846 with no adverse reaction or report of feeling ill. Traveled to store and arrived approx. 2 hours after receiving vaccine. Daughter stated patient felt well and had to go to the restroom to have BM. Collapsed in bathroom. Transported by ambulance to Hospital @ 1439 in cardiac arrest. Was in PEA and went in v fib back to PEA. Resuscitation efforts initiated and patient expired with time noted at hospital records at 15:11.	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
My dad received his first COVID vaccine on January 14, 2021. On January 16, 2021 he ate breakfast around 7:00 am and went back to his room. When the staff checked on him around 8:00 am they found my dad unresponsive. His blood pressure was over 220 and his pulse was 43. They began manual CPR until the paramedics arrived, but my dad died.	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
"Patient had COVID vaccination on 2/3 with no adverse s/s before leaving unit. Upon coming to treatment Friday 2/5 he reported to the RN that he had fallen on thursday 2/4 due to ""getting up fast"" did not hit head or hurt anything per RN discussion. Began treatment without difficulty. About 3/4 way through treatment was	No prior vaccinations for this event.

talking with staff and became unresponsive - code was called and pt expired after 30 minute resuscitation efforts."

RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine given in clinic per protocol - patient monitored for 15 minutes, no adverse reactions noted at the time. Patient stated he felt fine following 15 minute monitoring time. Patient left facility- it was later reported that pt had a fall at home. Upon review of pt's medical record - Pt's wife had to initiate CPR and call EMS for transportation and life saving measures enroute to the Emergency Room. Pt was intubated as pt was in asystole upon arrival to the ER, ACLS was continued, pt was noted to have a traumatic brain injury from his fall at home, and pt was pronounced dead at 1620.	No prior vaccinations for this event.

RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Short version The patient has long-standing health issues. The patient received the first dose of Moderna COVID-19 vaccine on 1/16/2021 (unknown location). The patient suffered an event in his home on 1/24/2021. CPR and treatment was begun and he was transported to the ED. He was pronounced dead in the ED at 0846. Long version 70-year-old male with past medical history of CAD with pacemaker, A. fib, COPD, hypertension/hyperlipidemia presenting in cardiac arrest. 911 call at 0724. Per EMS, patient was witnessed by family to have seizure-like activity and then collapsed and became unresponsive. Patient was noted by family to be pulseless and CPR was started right away. Patient received two doses of epi by police were on scene first (AED defibrillation x2) and six doses of epi (plus 6 more AED shocks) by EMS when they arrived. Patient had CPR performed for 45 minutes prior to arriving at the hospital. On route, patient had episodes of paced rhythm and V. fib. Patient received one amp of bicarb and one amp of calcium en route. Patient also received 300 mg of amiodarone en route. Arrived in ED at 0810 Patient received ongoing compressions, shocks and additional medications (epinephrine x6, lidocaine IV, sodium bicarbonate) until time of death called at 0846 in	No prior vaccinations for this event.

the ED.

	RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
ER visit 1/25/21 patient walked into a prompt care and collapsed, witnessed and pulseless CPR with ROSC after 6-7mins, no shock no meds. Awake and speaking upon arrival to ER. 2 plus pitting edema ble ER diagnosis Anasarca, cardiac arrest, hypotension, elevated troponin I levels, Acute kidney injury and syncope. ER notes reveal a syncopal episode in the shower prior to collapse at prompt care. Central line placed and plan to ship to another facility, patient continued to decline despite dopamine and dobutamine expired in ER prior to transfer.		No prior vaccinations for this event.

	RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
"Patient called EMS approximately 1pm on 2/15 with complaints of generalized weakness. Upon arrival EMS found her to be diaphoretic and she had a witnessed syncopal episode with question of v-fib and seizures. She became unresponsive and had no pulse. CPR was begun and she was transported to ED. She remained asystole throughout. CPR was initially continued in the ED for approximately 30 minutes and then stopped with Time of Death noted at 13:27. ED notes noted ""suspect given history that patient experienced massive MI, PE or ruptured AAA"". Death certificate notes indicate ""signficant conditions contributing to death after cardiac arrest; ASCVD""."		No prior vaccinations for this event.

	RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient was at a gym watching his daughter. He slumped over unconscious. EMS was called. He was found to be in fine ventricular fibrillation and resuscitation efforts failed. He was brought to Hospital ED where he was pronounced dead. He had underlying cardiac disease but his family requested I report this event as possibly		No prior vaccinations for this event.

related to the recent COVID vaccination.

RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Per EMS/Hospital report patient had difficulty breathing and cardiac arrest with prolonged CPR (greater than 45 mins in the ER) who was resuscitated. Family subsequently arrived including son and daughter and all family members were in the ER room are in agreement that patient would not want further aggressive cares given her extremely poor prognosis in light of chronic debilitation with numerous medical issues and now a very long period of CPR. Hospital Course After updating family they stated patient would not want further aggressive cares given her grim prognosis and chronic severe and debilitating medical issues. She continued to have myoclonic jerking. She was extubated to comfort cares in the ER and did not pass immediately therefore brought to a room. She received comfort cares and passed away at 0450 with family present.	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
"The patient came to the Emergency Room at approx 3:30 am on 02/03/2021 with pain in right arm (same arm the COVID vaccine had been administered in approx 12 hours earlier) and feeling generally unwell. Patient was concerned about possibility of gout flare or that something was wrong with her arm. Elevated blood pressure was noted; this was attributed to anxiety. She was evaluated, given 500 mg Tylenol, and discharged since the pain was decreasing and blood pressure was stabilized. Patient instructed to follow-up with physician. The next day, on 02/04/2021, the patient arrived at the Emergency Room by ambulance; cardiac arrest was the chief complaint. The patient's daughter stated the patient had been ""feeling generally poor and then suddenly collapsed."" Daughter described ""gurgling respirations"" and being unresponsive. 911 was called, police arrived within 5 minutes and initiated CPR. Epinephrine, atropine, lidocaine and bicarb administered after arrival to Emergency Room. Shockable rhythm never demonstrated. Patient never recovered spontaneous respiration or movement. The death was called at 23:04. Coronary artery disease with	No prior vaccinations for this event.

cardiac arrest is the cause from the ER records; the coroner is putting COVID-19 vaccination in Part 1 of the death certificate."

	RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.		No prior vaccinations for this event.

	RESUSCITATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient previously had dizzy spills, but about a week after receiving the vaccine her dizzy spills began to get worse. The whole prior she kept saying I am just not right. On the 2/7/21 she a COVID test done, a nurse came to her house and preformed. On the morning of the 8th patient was on the phone with someone else and patient asked this person to call me and go check on her. Within 5 minutes I was over at her house, and I found her on the floor, she on her belly facedown. It looked like she was on the toilet, and it looked like she fall getting her off, she was still wet, she still felt warm. I called the ambulance and immediately began CPR. When EMS arrived they took over the CPR and transported her to the Hospital. The EMS was there for about 40 minutes and used an machine to preform the compressions. She was pronounced deceased at the hospital. No autopsy was done.		No prior vaccinations for this event.

RESUSCITATION		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient was found unconscious without a pulse. Patient remained in asystole without pulse or respirations despite CPR.		No prior vaccinations for this event.
RESUSCITATION		**COVID19 (COVID19 (MODERNA)) (1201)**
Per ED note: Brought in ED by EMS at 1945 for acute shortness of breath and hypotension. Patient was placed on supplemental oxygen and covid test completed. Patient was placed on BiPAP to maintain oxygen greater than 90%. Found to be in metabolic acidosis. Patient became unresponsive and pulse could not be palpated. Chest compressions were initiated. ACLS medications given and pulses regained. Patient lost pulse 30 mins later and never regained pulse. Per ED noted; likely developed a PE. Passed away at 2127		No prior vaccinations for this event.
RESUSCITATION		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient passed away Saturday at 14:04pm. Patient's wife reports his death was sudden, he passed away sitting in his chair his heart just stopped she said. They tried to perform CPR, 911 was called and paramedics arrived at the scene and he was given medication but never had any return of vital signs and so his death was called at the scene. Wife reports he was not ill, did not have any symptoms prior to the event. They are not going to be doing a autopsy. She wanted us to know based on timing that there may be some possible correlation with his COVID19 vaccine. He obtained the vaccine on 02/09/2021 - wife reports he had no symptoms, not even arm soreness after the vaccine. Had no fever, shortness of breath. Did not complain of chest pain. We can update chart to reflect the patient is deceased and lets make a card for the family.		No prior vaccinations for this event.

Patient arrived at ER with complaints of CPR in progress. Per EMS, patient became short of breath while performing yard work on 1/26/2021. At arrival, patient was in fine v fib with a total of 6 shocks delivered along with 300 mg amiodarone followed by 150 mg amiodarone, 1 amp epinephrine and 2 epinephrine drips adminstered en route to ED. CPR initiated at 1755 and EMS reports asystole at 1829. TOD 1909 pronounced by ED DO Dx: Cardiac arrest	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Per EMS, the patient was last seen walking and talking to wife 10 minutes prior to EMS arrival. EMS reports via patients wife, that patient was upstairs to change for his doctor appointment then patient's wife found him down. The patient received his COVID-19 vaccine on 1/25/21. EMS states they gave 5 rounds of EPI then patient moved into vfib then was shocked once but returned to asystole. In ED, the patient initially in asystole CPR was started immediately. The patient was given 3 rounds EPI, 1 round bicarb. The patient stayed in PEA throughout. Patient was given tPA. Patient continued to be in asystole and time of death was called at 11:35 am.	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Was at work on 1/26/21 and collapsed, no known complaints a the time. CRP was initiated immediately, transported to ER and pronounced dead	No prior vaccinations for this event.

	RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
family states seemed short of breath since after the covid vaccine. Staff said beginning on 1/22/21 the patient seemed sluggish, more tired, and nausea noted. She stayed in her room more after the vaccine because worried about giving/getting COVID to others. was talking on the phone at 11:30 PM on 1/26/21 to staff person about temperature of room. at 12:15 AM on 1/27/21 staff noted not breathing, started CPR and called EMS. When EMS arrived they stopped the code because she was too long deceased.		No prior vaccinations for this event.
	RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An 85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19 immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything, nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the		No prior vaccinations for this event.

vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30 (on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart stopped"

RESUSCITATION

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
Patient noted to have irregular breathing in bed and unable to arouse. Provided life saving measures in the field x 30 minutes and transferred to hospital. Noted to have heart arrhythmia which suspected to cause cardiac arrest.	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
dead; Collapsed; bnt162b2 was given to patient with immunocompromised w/ reportable conditions; bnt162b2 was given to patient with immunocompromised w/ reportable conditions; This is a spontaneous report from a contactable nurse. A 40-year-old male patient receive first dose of bnt162b2 (Lot number: EK9231, Brand: Pfizer), intramuscular in left arm on 21Jan2021 15:15 at single dose for COVID-19 immunization. Medical history included immunocompromised w/ reportable conditions from an unknown date and unknown if ongoing, positive for Covid in September from Sep2020 to an unknown date. The patient's concomitant medications were not reported. The patient experienced dead, collapsed on 26Jan2021. Therapeutic measures were taken as a result of collapsed. The outcome of collapsed was unknown. The patient died on 26Jan2021. It was not reported if an autopsy was performed. Received Covid vaccine here on 21Jan2021, was at work on 26Jan2021 and collapsed, no known complaints at the time, CPR (cardiopulmonary resuscitation) was initiated immediately, transported to ER (Emergency room) and pronounced dead. Unknown if other vaccine in four weeks. The patient had COVID prior vaccination. Unknown If COVID tested post vaccination.; Sender's Comments: Based on the information currently provided, the patient was immunocompromised and had prior COVID infection. The death and syncope more likely are associated with the patient underlying medical conditions. More information such medical history, concomitant medications, treatment indication and event term details especially death cause and autopsy results are needed for fully medical assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and	No prior vaccinations for this event.

analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Dead

"Myocardial infarction Narrative: PMH significant for aortic valve stenosis, mitral valve stenosis, CKD, CHF, DM, HTN, obesity, hypothyroidism and dyslipidemia. Per report from primary care - the patients wife reports that the patient went on Saturday (1/30/21 - about 1050) morning to receive his COVID vaccine. He returned home and told her about the experience and denied any side effects. He then proceeded to sit in his easy chair for a while and around 1:30, she asked him if he wanted any lunch. The patient's wife reports he ""grumbled"" at her, and then got up to go to the bathroom. She then heard a loud crash and found him lying on the floor of the bathroom, with his head knocking hole in the wall as he fell. She could not detect a pulse. She called 911 and began compressions. First responders to the scene likewise tried to revive him but were not successful in her efforts. Per primary care documentation - Uncertain if related to Pfizer vaccine; vaccine administered on 1/30/21 and approximately 3 hours later suffered fatal MI at home."		No prior vaccinations for this event.
	RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient expired. Per Emergency MD note: ""This is a 72-year-old male with what sounds like diabetes, atrial fibrillation, and hypertension who presents via EMS in cardiac arrest. It sounds like he received his Covid vaccine last week. Initially he had some mild effects from it. However over the last day or so he has felt very unwell. He apparently called his wife today and told her that he was not feeling well and so she returned home. Shortly thereafter he attempted to get up from his chair. He then collapsed and fell forward		No prior vaccinations for this event.

onto his face. Sounds like his wife had some difficulty rolling him over to perform CPR. When EMS arrived they found him in PEA. He received a total of 5 rounds of epinephrine. At some point they did have return of spontaneous circulation. However just prior to arriving in the emergency department they lost pulses again. The patient was intubated with an 8 oh endotracheal tube prior to arrival."""

RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into	No prior vaccinations for this event.

full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of

pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and ACLS guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and ACLS guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.	No prior vaccinations for this event.

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off

No prior vaccinations for this event.

to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

RESUSCITATION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

For the two days prior to presentation the patient had been complaining of chest pain, his breathing seemed to be labored Monday. He and the family thought the pain was due to shingles as he carried this diagnosis from a month ago. Patient had also received the COVID vaccine 2 days prior to presentation and assumed he was feeling unwell due to the vaccine. Family wanted to take him to the hospital yesterday and earlier today but he refused. She left him in his home earlier this afternoon prior to presentation and returned to check on him finding him unresponsive and apneic at which time EMS was activated. #cardiac arrest -- suspect primary cardiac given collateral from family at home, consider hypoxemia which was corrected with advanced airway and 100% FiO2, patient clinically euvolemic and with soft brown stool in diaper not

"Patient and her husband are elderly, but healthy and live independently. Patient took blood pressure medicine 'off and on' according to family. She was 5'2"", 120 pounds and slim and healthy and active, so was her husband, though he had pulmonary fibrosis so they had been staying home and not attending church etc, and masking when they did go out to protect against covid disease. They were both vaccinated		No prior vaccinations for this event.

with covid Pfizer vaccine (dose #1) on Thursday Feb 11. (02/11/2021) Thursday night as they went to bed they checked in with each other on how they each felt. Patient said she felt totally fine, and her husband said his arm was a bit sore. Patient woke before her husband on Friday Feb 12, went downstairs and, from what the family can tell, fixed herself a snack, then sat on the sofa. Patient's husband found her deceased on the sofa. He called 911 and they asked him to do CPR until the paramedics arrived. Because of proximity to covid vaccine, the ME wanted to examine the body in the home and also ordered an autopsy. Autopsy was completed on the same day as death, Feb 12, 2021"

	RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done to save his life. He subsequently passed away @ approximately 8:55 am CST on 2/11/21.		No prior vaccinations for this event.

	RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.	No prior vaccinations for this event.

RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Resident found unresponsive in his room. CPR performed and patient expired. No prior vaccinations for this event.

RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident found unresponsive, CPR initiated and EMS called. EMS called time of death after arrival.	No prior vaccinations for this event.

RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Pt received 2nd Pfizer BioNTech Covid 19 EUA vaccine @1:50 pm; Pt released from Observation @2:09 pm. Approximately 2:18 pm RN called to parking lot and observed pt having difficulties. Called for EMS & crash cart. Vitals taken 2:20 BP 83/55, no respirations noted, pt unresponsive. AED attached. EMS arrived 2:22 and took over care of pt. and transported @2:40 pm to Hospital. Per wife, pt has history of PE in Oct. 2020, HTN, diabetes with insulin pump, obesity, gastroparesis, home oxygen and uses motorized scooter. Wife also said pt had allergy to iodine not previously reported, and MD had stopped Zarelto subsequent to 1st Pfizer vaccine 2/8/21 ""due to breathing difficulty"". Patient was unable to be resuscitated. Time of death 14:59."	No prior vaccinations for this event.

RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient had an unwitnessed cardiac arrest while outside walking his dog. AED in the field initially advised shock and was shocked 3 times without effect. At the time EMS ALS arrived, patient was in PEA arrest. He was transferred to Hospital with CPR in progress. Time of death called at 1857.	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
DEATH Narrative: Presented to ED via EMS c/o increasing shortness of breath, O2 sat mid to high 80s on 4L. When EMS arrived , pt was in distress, intubated by EMS and transported to ED. Pt had a PEA arrest en route but resuscitated w/ return of spontaneous circulation after receiving a dose of epinephrine and chest compressions. Pt was hypotensive on arrival to ED. He was started on sepsis protocol , volume resuscitation and empiric antibiotics. Once stabilized, he was admitted to icu at hospital. Removed from respirator 2/22/21	No prior vaccinations for this event.
RESUSCITATION	**COVID19 (COVID19 (UNKNOWN)) (1202)**
Patient was admitted to hospital from home in cardiac arrest. Hx of hypertension, hyperlipidemia, type 2 diabetes (not on insulin) and bilateral carotid artery stenosis. The patient was reportedly at his baseline health on 2/2/21. He received the 2nd dose of COVID vaccine around 1000AM on 2/2/21. Reportedly started running fever of 100.1 and chills the afternoon of 2/2/21. Around 7:00PM he started having dry cough and was complaining of breathing difficulties. He subsequently vomited multiple times (was eating pizza and aspirated) then lost consciousness. His wife called 911, did CPR and EMS reported he in PEA at scene and was intubated. Transported to hospital. SARS CoV-2 and influenza negative.	No prior vaccinations for this event.

RESUSCITATION

COVID19 (COVID19 (UNKNOWN)) (1202)

Received first SARS-CoV2 vaccination yesterday at local store Experienced new symptoms of chills, nausea as well as worsening from baseline dyspnea at night. Wife states he had rough morning breathing and had sudden loss of consciousness and unresponsiveness and failed to respond to bystander CPR. He expired at his home.

No prior vaccinations for this event.

RETCHING

COVID19 (COVID19 (MODERNA)) (1201)

We don't know what happened. 25 hours after the shot, he started gagging and stopped breathing. He was pronounced at OSF at 8:07pm after we took him off life support.

No prior vaccinations for this event.

RETCHING

COVID19 (COVID19 (MODERNA)) (1201)

Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.

No prior vaccinations for this event.

RETCHING

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/22/2021 10:09 pm resident reported 1 episode of being nauseous and having dry heaves, no temperature, MD notified and nurse was told to continue to monitor, no new orders, daughter made aware. Vital signs being done every 4 hours. 2/23/2021 3:04am resident complains of nausea, scant BM amount x 2, MD notified and no new orders, continue to monitor and encourage fluids, vital signs continue every 4

No prior vaccinations for this event.

hours.

	RETICULOCYTE COUNT INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt received dose #1 of COVID-19 vaccine (Pfizer-BioNTech) on 12/18/20 and dose #2 (Pfizer-BioNTech) on 1/8/21. On 1/30, patient was evaluated at urgent care due to back pain. No bloodwork done; metronidazole prescribed for 7 days. On 2/8, patient was admitted to outside hospital due to ongoing symptom progression. At time of admission, hgb 5 g/dL and plt 9k. Per Dr. (hematology/oncology), pt with schistocytes, LDH 1500, and elevated reticulocyte count consistent with thrombotic thrombocytopenic purpura (TTP). SCr >2 mg/dL. Patient immediately treated with plasma exchange and steroids, however continued to decline. Patient expired on 2/14/21.		No prior vaccinations for this event.
	RHABDOMYOLYSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt was hospitalized Jan 18, 2021 after he had fallen outside overnight and lay there approximately 12 hours until he was found. Hypothermic & rhabdomyolis diagnosis. Gradually improved w/ strength & mental status - was in swing bed @ hospital. He got his first Covid 19 shot on 2-8-21. Was fine @ 0300 on 2-9-21 and @ 0430 he was found unresponsive. Dx: probable arrythmia & pronounced dead @ 0454. Noted on pain scale @ 2/8/21 @ 21:11, clients pain was a 7/10 They offered pain med & he refused They repositioned & distracted him @ 2047 on 2/8/21 Pain had decreased to 3/10 and nothing given. Then @ 0300 check he was sleeping and @ 0430 unresponsive.		No prior vaccinations for this event.
	RHABDOMYOLYSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Pt received vaccine on 7 jan. 2021 Twelve days later, on 19 January 2021, Pt developed symptoms of COVID (cough, sore throat, fever, myalgias), on 20 Jan, pt admitted to hospital for worsening symptoms. Pt tested positive for COVID 19. Pt admitted to ICU where pt had complicated hospital course to include ARDS secondary to COVID pneumonia, nonSTEMI, with biventricular heart failure, on multiple pressor, rhabdomyolysis with acute kidney injury, requiring CRRT. Pt was in hospital for 10 days; he passed away on 31 Jan 2021.	No prior vaccinations for this event.

RHEUMATOID ARTHRITIS	**COVID19 (COVID19 (MODERNA)) (1201)**
I helped facilitate scheduling for his COVID vaccine and received notification from his wife that he passed away unexpectedly this morning. She reported he had been experiencing a rheumatoid arthritis flare and was on steroids. His diabetes was not well controlled as a result. He did not have any reactions in the days immediately after the vaccine.	No prior vaccinations for this event.

RHEUMATOID ARTHRITIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
COVID 19 symptoms and a positive test was confirmed on 1/6, employee noted previous exposure to positive family members Narrative: Employee noted exposure to COVID prior to presenting for 1st dose of vaccine on 1/5/21. On 1/6/21 employee reported the onset of symptoms and was tested and was confirmed COVID positive that day. Positive result was reported to employee health on 1/8/21. Employee Health continued to track employees progress and was informed of the need for hospitalization on 1/14/21. Course of hospitalization noted the need for intubation and significant issue with comorbid condition (rheumatoid arthritis). Employee died on 2/9/2021. Unable to confirm a direct connection to Vaccine vs. COVID infection, but felt it should be reported.	No prior vaccinations for this event.

RHINORRHOEA		**COVID19 (COVID19 (MODERNA)) (1201)**
Resident expired on 2/5/21 at 03:35pm, about 25 hours after second dose of vaccine. At breakfast, resident was spitting a lot of secretions, coughing up liquids from nose and phlegm, facial swelling, which were all symptoms that he was struggling with prior to both doses of COVID vaccine, but had increased more than prior incidences on 2/5/21. Gurgling noted in upper airways, hyscolamine given, bath given to loosen secretions, morphine given. Family notified and came into facility for compassionate care visit around 1300. 1400 HR was 3 and RR was 2, but increased back to 60 and 12 within 20 minutes. Then resident expired at 1535.	No prior vaccinations for this event.	
RHONCHI		**COVID19 (COVID19 (MODERNA)) (1201)**
2/2/21-1000-patient presented to the local emergency room with complains of fever, shortness of breath and decreased oxygen sats. temp 101.7, pulse 102, respirations 36, BP 141/92, oxygen 94%. Lung sounds crackles bilaterally with rhonchi on the left. patient worked up for sepsis, CXR shows mild atelectasis. blood pressure dropped, and continued to drop through treatment requiring levophed drop to be initiated. Patient POA determined that this would not be her sister's wishes and made the decision to make patient comfort care status. 2/3/21- patient lethargic throughout night. 0640-patient demise.	No prior vaccinations for this event.	
RIB FRACTURE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac	No prior vaccinations for this event.	

arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex.

There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

ROAD TRAFFIC ACCIDENT	**COVID19 (COVID19 (MODERNA)) (1201)**
On 1/23/21 the patient had a single-car accident, slid off icy road into snowbank. She was seen in our ER, diagnosed w/ trauma and L4 compression fracture. She was transported to Hospital for further trauma workup. We believe she was treated and released. On 1/31/21 the patient had a headache but did not seek medical attention. In the morning of 2/1 she became unresponsive and was pronounced dead on the scene when EMS arrived. Autopsy showed a left temporal subdural hematoma.	No prior vaccinations for this event.
ROAD TRAFFIC ACCIDENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
She started having breathing problems/heart attack appearance. on 1/22/21 and went to the ER. Upon admittance was told it was an anaphylactic shock from the Covid shot. They kept her in ICU and released her 1/23/21. At 12:45 am on 1/24/21 she passed out and we called the ambulance. Hospital admitted her and worked through multiple organ failure issues and thought her numbers were under control. She was released on 1/27/21 and was driving on 1/28/21 around 4:15 pm and appears to have had heart failure and had a wreck. She passed away that day.	No prior vaccinations for this event.
RUPTURED CEREBRAL ANEURYSM	**COVID19 (COVID19 (PFIZER-BIONTECH))**

	(1200)
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."	No prior vaccinations for this event.
SALIVARY HYPERSECRETION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient has been under Hospice services for almost a year. She began to demonstrate a large amount of	No prior vaccinations for

oral secretions on 1/10/21 at 2130. She was suctioned and a Rapid COVID-19 test was performed, which was negative. The COVID-19 Rapid test was repeated on 1/11/21 and was positive. Oxygen saturation was noted to be 78% on 1/12/21, and oxygen was initiated at 1133 at 3L per nasal cannula. Oxygen was increased to 4L at 1635 d/t shortness of breath. On 1/15/21 @ 0645 patient was unresponsive and without vital signs. Orders were for DNR and CPR was not initiated.		this event.
	SARS-COV-2 ANTIBODY TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
cardiac arrest due to pericardial effusion; cardiac arrest due to pericardial effusion; On 21Feb he went to the ER after vomiting and passing out; On 21Feb he went to the ER after vomiting and passing out; On 19Feb, he began to feel ill again with a fever. He felt worse on 20Feb; On 19Feb, he began to feel ill again with a fever. He felt worse on 20Feb; fever; headache; stomach upset; This is a spontaneous report from a contactable consumer reporting for the father: A 75-year-old male patient received the 1st dose of bnt162b2 (BNT162B2, Lot # EL3428) at single dose at left arm on 03Feb2021 for Covid-19 immunisation. Medical history included type 2 diabetes mellitus. No known allergies. The patient had not experienced Covid-19 prior vaccination. Concomitant medication in 2 weeks included amitriptyline hydrochloride (manufacturer unknown) 10 mg, atorvastatin (manufacturer unknown) 20 mg, dutasteride (manufacturer unknown) 0.5 mg, linaclotide (LINZESS) 290 mcg, gabapentin (manufacturer unknown) 300 mg, montelukast (manufacturer unknown) 10 mg, ramipril (manufacturer unknown) 5 mg, insulin degludec (TRESIBA) 100 unit/ml, liraglutide (VICTOZA) 18 mg/3ml solution. No other vaccine in 4 weeks. The patient experienced cardiac arrest due to pericardial effusion on 21Feb2021 14:15, fever on 13Feb2021, headache on 13Feb2021, stomach upset on 13Feb2021, on 19feb, he began to feel ill again with a fever, he felt worse on 20feb on 19Feb2021, on 21feb he went to the ER after vomiting and passing out on 21Feb2021. Events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of cardiac arrest due to pericardial effusion. Course of events: In Feb2021, 10 days after his 1st injection, the patient developed fever, headache, and stomach upset. He went for a rapid Covid-19 test (nasal swab) and it was negative on 11Feb2021. The doctor told him		No prior vaccinations for this event.

he might be having a delayed reaction to the vaccination. After a couple of days, he improved. On 19Feb2021, he began to feel ill again with a fever. He felt worse on 20Feb2021. On 21Feb2021 he went to the ER after vomiting and passing out and received treatment: IV fluids, diagnostic testing at ER. Rapid Covid test (nasal swab) at ER came back negative again on 21Feb2021. His heart arrested suddenly and he could not be resuscitated. CT scan results, that came back after death, showed Covid like pneumonia and pericardial effusion. The patient died on 21Feb2021 14:15. Cause of death was cardiac arrest due to pericardial effusion. An autopsy was not performed. The outcome of cardiac arrest due to pericardial effusion was fatal, of fever, headache, stomach upset was recovering, of he began to feel ill again with a fever, he felt worse was not recovered, of he went to the ER after vomiting and passing out was unknown.; Reported Cause(s) of Death: cardiac arrest due to pericardial effusion; cardiac arrest due to pericardial effusion

SARS-COV-2 ANTIBODY TEST NEGATIVE

COVID19 (COVID19 (MODERNA)) (1201)

Pt developed COVID-19 infection, symptoms starting 7 days after first dose was given. Patient was admitted to hospital on 1/21 after falling (secondary to weakness) and striking head on toilet. Patient expired due to respiratory complications of COVID on 1/25.

No prior vaccinations for this event.

SARS-COV-2 ANTIBODY TEST NEGATIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

respiratory distress; fever; anxiety developed requiring oxygen; Passed away; This is a spontaneous report via a Pfizer-sponsored program from a non-contactable consumer. A 63-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot and expiry not reported), via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunization. Medical history included anaphylactic reaction (broad), neuroleptic malignant syndrome (broad), anticholinergic syndrome (broad), acute central respiratory depression (broad), hypersensitivity (broad), respiratory failure (narrow),

SARS-COV-2 TEST **COVID19 (COVID19 (MODERNA)) (1201)**

Passed away; tired; nonresponsive; cold; difficulty breathing; swelling; sore arm; feeling weird and funny; A spontaneous report (United States) was received from a consumer concerning a 63 year old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and the patient experienced limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal and the patient passed away . Medical history included treatment for tuberculosis and dialysis. Concomitant medication included calcium acetate, Renvela, glipizide, omeprazole, aspirin, vitamin D, losartan, furosemide, rifampin, and Sensipar. On 14 Jan 2021, the patient received the first of their first planned doses of mRNA-1273 (lot number 030L20A) for prophylaxis of COVID-19 infection. On 13 Jan2021, the patient tested negative for COVID-19). On 16 Jan 2021, the patient experienced a sore arm, and feeling weird/funny. On 17Jan2021, the patient experienced difficulty breathing and swelling. On 18 Jan 2021, the patient declined dialysis, was tired and wanted to lay down. At 8 am, the patient was found nonresponsive and cold and is believed to have passed away around 4 am. The coroner tested the deceased for COVID-19 and the test was positive. No autopsy was reported. No death certificate was issued at the time of the report but the reporter believes it will list cause of death as COVID complications. Action taken with the mRNA-1273 was not applicable. The outcome of the events of limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal, was fatal. On 18 Jan 2021, the patient was died. Cause of death was COVID-19. Autopsy details were not provided.; Reporter's Comments: The events developed on four days after first dose of mRNA-1372. Dyspnea, unresponsive to stimuli, and death were consistent with infection in pandemic set up confounded by age of patient and refusal of dialysis Cause of death was reported as COVID-19. Autopsy details were not provided. Based on reporter's causality the events are assessed as unlikely related to mRNA-1273.; Reported Cause(s) of Death: COVID-19

No prior vaccinations for this event.

SARS-COV-2 TEST		**COVID19 (COVID19 (MODERNA)) (1201)**
Per ED note: Brought in ED by EMS at 1945 for acute shortness of breath and hypotension. Patient was placed on supplemental oxygen and covid test completed. Patient was placed on BiPAP to maintain oxygen greater than 90%. Found to be in metabolic acidosis. Patient became unresponsive and pulse could not be palpated. Chest compressions were initiated. ACLS medications given and pulses regained. Patient lost pulse 30 mins later and never regained pulse. Per ED noted; likely developed a PE. Passed away at 2127		No prior vaccinations for this event.
SARS-COV-2 TEST		**COVID19 (COVID19 (MODERNA)) (1201)**
"""Feeling Hot"" without fever and nausea 10 hours post vaccine and resolved within 1 hour. Seizure, Hypotension, Unresponsive followed shortly by cardiac arrest and pulseless electrical activity 21 hours post vaccine. Pronounced dead 22 hours post vaccine"		No prior vaccinations for this event.
SARS-COV-2 TEST		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Called PCP, from the note: I got my shot on Jan 19. But last Friday I have been down with a horrible flu. I'm wearing diapers because of uncontrollable diarrhea. I can't leave my sofa to walk over to my desk because I'll be so out of breath. I have a cough that produces a pink or gold Phelm I have dry mouth. I have no appetite I'm so weak and have lost 15 pounds. Don't know what to do. My next Covid is shot is feb 11 Called employer on 2/3/21 but hung up. Tried calling multiple times to follow up. In triage she stated she had a COVID test scheduled and had spoken with her PCP. COVID test through PCP: 2/4/21 She passed away the night of 2/4/21		No prior vaccinations for this event.

	SARS-COV-2 TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."		No prior vaccinations for this event.
	SARS-COV-2 TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Stroke; This is a spontaneous report from a contactable consumer. A 94-year-old female patient received		No prior vaccinations for

the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 16Jan2021, at single dose, for COVID-19 immunisation. Medical history included ongoing hypertension (took medication). Patient did not have COVID-19 prior to vaccination. Concomitant included unspecified medication for hypertension. The patient experienced stroke on 31Jan2021. The patient was brought to the emergency room and hospitalized due to the event on 31Jan2021. No therapeutic measures were taken as a result of the event. The patient underwent lab tests and procedures which included COVID-19 virus test: negative in Feb2021 (a week before report); investigation: brain bleed and discovered she had a stroke (on unknown date in 2021). The patient died on 03Feb2021 due to stroke and old age. An autopsy was not performed. Patient's family did not attribute her death to the vaccine at all. The information on the Lot/Batch number has been requested.; Reported Cause(s) of Death: stroke; Old age		this event.
	SARS-COV-2 TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
respiratory failure from COVID19; presented to the ER with COVID symptoms and was diagnosed/died on 09Feb2021 from respiratory failure from COVID19; presented to the ER with COVID symptoms and was diagnosed/died on 09Feb2021 from respiratory failure from COVID19; This is a spontaneous report from a contactable physician. An 89-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in 10Jan2021 at 12:00 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had no COVID prior to vaccination. The patient received one dose of Pfizer vaccine on 10Jan2021. The patient was presented to the ER with COVID symptoms and was diagnosed on 27Jan2021. Patient subsequently died on 09Feb2021 from respiratory failure from COVID19. It was unknown if autopsy was done. The patient was tested for COVID post vaccination via nasal swab: covid-19 virus test positive on 27Jan2021. The events resulted in emergency room/department or urgent care, hospitalization, and patient died. No follow-up attempts are possible, information about batch number		No prior vaccinations for this event.

cannot be obtained. No further information is expected.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported COVID post vaccination and respiratory failure with fatal outcome, and the administration of COVID 19 vaccine, BNT162B2, based on the reasonable temporal association. More information on the underlying medical condition in this 89-year-old male patient is required for the Company to make a more meaningful causality assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.; Reported Cause(s) of Death: presented to the ER with COVID symptoms and was diagnosed on 27Jan. Patient subsequently died on 09Feb from respiratory failure from COVID19; presented to the ER with COVID symptoms and was diagnosed on 27Jan. Patient subsequently died on 09Feb from

SARS-COV-2 TEST	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Is patient deceased: Yes; Low pulse; This is a spontaneous report from two contactable nurses reporting for a patient. A 70-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL0140 expiration date Mar2021) intramuscular on 22Dec2020 at 10:30 at single dose in right arm for COVID-19 immunisation. The patient was vaccinated at Nursing Home. Patient age at time of vaccination was 70 years. Patient's Medical History included ongoing Type 2 Diabetes Mellitus Without Complication onset date: admission 22Oct2020, ongoing morbid obesity due to excess calories onset date: admission 22Oct2020, cardiac disorder, essential hypertension, hypertension, schizophrenia, hyperlipidemia, benign prostatic hyperplasia (BPH), Gastrooesophageal reflux disease (GERD), depression, hypothyroid, epilepsy, pain, dry eyes, anxiety, restlessness, 17Jan2020 Slid out of chair to floor, no injury, on 27Jan2020, 28Jan2020, 29Jan2020 diarrhea noted. Concomitant medications included acetylsalicylic acid (ASPIRIN EC) for Cardiac Health, atenolol (ATENOLOL) for Essential Hypertension, atorvastatin	No prior vaccinations for this event.

calcium (ATORVASTATIN CALCIUM) for hyperlipidemia, finasteride (FINASTERIDE) for benign prostatic hyperplasia, tamsulosin hydrochloride (FLOMAX) benign prostatic hyperplasia, insulin glargine (LANTUS) for diabetes mellitus, lithium carbonate (LITHIUM CARBONATE) for Schizophrenia, losartan potassium (LOSARTAN POTASSIUM) for hypertension, lurasidone hydrochloride (LURASIDONE HYDROCHLORIDE) for Schizophrenia, omeprazole (OMEPRAZOLE) for gastrooesophageal reflux disease, sertraline hcl (SERTRALINE HCL) for depression, levothyroxine sodium (SYNTHROID) for hypothyroid, ergocalciferol (VIT D) for supplement, haloperidol (HALOPERIDOL) for Schizophrenia, levetiracetam (KEPPRA) for epilepsy, paracetamol (TYLENOL EXTRA-STRENGTH) for pain, propylene glycol (ARTIFICIAL TEARS) for dry eyes, lorazepam (ATIVAN) for a anxiety or restlessness. As antipyretic use was reported Tylenol ES (500 mg) Tab, 2 Tabs by Mouth Routine use three times a day given at time of vaccination and after. It was reported the patient was Covid+. He was tested on 21Dec2020 and was not admitted to hospital. Event Onset Date was reported as 24Dec2020 (clarification pending). On 30Dec2020 the patient was started on O2 at 2L for low pulse. O2 was increased over time to eventually O2 at 8L on 03Jan2021. Morphine Sulfate was started on 03Jan2021 at 5 mg sl/by mouth every 2 hours as needed for pain or airhunger. The patient deceased on 03Jan2021. The cause of death was unknown. It was not reported if an autopsy was performed. The AEs did not require a visit to Emergency Room or Physician Office. Outcome of Low pulse was unknown.; Sender's Comments: Based on the information available the events Death (unknown cause) and Heart rate decreased are attributed to patient's multiple underlying medical conditions including Type 2 Diabetes Mellitus, morbid obesity, cardiac disorder, hypertension, epilepsy etc. However, based solely on a vaccine-event chronological association, contributory role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to the above mentioned events cannot be completely excluded. The case will be reevaluated should additional information, including the cause of death, become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Is patient deceased: Yes

SARS-COV-2 TEST	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"death was from natural causes; collapsed; This is a spontaneous report from a contactable consumer. A 73-year-old female patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 05Feb2021 at 73-years-old at a single dose for COVID-19 immunization. The patient's medical history included chronic obstructive pulmonary disease (COPD) from an unknown date and unknown if ongoing (on oxygen as needed, but not every day), oxygen therapy from an unknown date and unknown if ongoing. Concomitant medications were not reported. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (Gets flu shot every year around October). On 06Feb2021, the patient collapsed (medically significant) and experienced death was from natural causes (death, medically significant). The clinical course was reported as follows: The reporter stated that his grandmother received the first dose of the Pfizer COVID-19 vaccine on 05Feb2021 and passed away on the morning of 06Feb2021. The patient went to bed and woke up in the middle of the night around 03:00 to use the bathroom and collapsed and died within 10-15 minutes of collapsing. The patient was pronounced dead at the scene. The reporter asked: ""What do you know about the news in the media about reports of death in nursing home elderly patients?"" The reporter wanted to know the ingredients of the Pfizer COVID-19 vaccine. The reporter wanted to know about the use of the Pfizer COVID-19 vaccine in patients with underlying conditions. The patient had COPD and was on oxygen as needed, but not every day. The Medical examiner said the death was from natural causes and the family was not doing an autopsy. The patient had been tested for COVID and was negative. The patient underwent lab tests and procedures which COVID test: negative on an unspecified date. The clinical outcome of the event, death was from natural causes, was fatal. The clinical outcome of the event, collapsed, was unknown. The patient died on 06Feb2021 due to death was from natural causes. An autopsy was not performed. The batch/lot numbers for the vaccine, bnt162b2, were not provided and will be requested during follow up.; Reported Cause(s) of Death: death was from natural causes"	No prior vaccinations for this event.

SARS-COV-2 TEST	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected	No prior vaccinations for this event.

area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for

safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

	SARS-COV-2 TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"never woke up after arrival; Suffered with vascular dementia; Death cause: Covid/Tested positive to Covid 31Jan, tested due to increased lethargy; This is a spontaneous report from a contactable consumer. An 85-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Jan2021 at single dose for COVID-19 immunization. The patient received the vaccine at nursing home/senior living facility. Medical history included dementia, hypertension, past strokes. The patient was exposed to asymptotic staff member on or prior to 25Jan2021. The patient had no known allergy. No COVID prior vaccination. Concomitant medication included lisinopril. No other vaccine was received in four weeks. The patient was tested positive to COVID on 31Jan2021, tested due to increased lethargy started from 26Jan2021. The patient suffered with vascular dementia. She was ambulatory up to 31Jan2021. The patient was sent to hospice that evening on 31Jan2021 to quarantine, never woke up after arrival. Palliative Care started 02Feb2021, the patient expired 12Feb2021. Cause of death was COVID. The patient did not receive treatment for events. The autopsy was not performed. The outcome of events ""never woke up, vascular dementia"" was unknown. Information on Lot /Batch Number has been requested.; Reported Cause(s) of Death: Death cause: Covid"		No prior vaccinations for this event.
	SARS-COV-2 TEST	**COVID19 (COVID19 (PFIZER-BIONTECH))**

(1200)

pulmonary edema; Low heart rate; chest pain; This is a spontaneous report from a contactable pharmacist. An 80-years-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left arm on 28Jan2021 at single dose for COVID-19 Immunisation. Medical history included dementia, high blood pressure, COVID prior vaccination. He had no known allergies. Concomitant medication included diltiazem hydrochloride (CARDIZEM), anastrozole (ARIMIDEX), simvastatin and lorazepam. Historical Vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 07Jan2021 (at the age of 80-years-old) at single dose for COVID-19 Immunization. There was no other vaccine received in four weeks. The patient experienced pulmonary edema, low heart rate and chest pain on 26Feb2021. The events resulted in hospitalization and patient died. The patient was hospitalized from 26Feb2021 for 1 day. Treatment received for the events included Epinephrine, morphine, nitroglycerine. The patient underwent lab tests and procedures which included Covid test Nasal Swab post vaccination on 26Feb2021 indicated Negative. The patient died on 26Feb2021. An autopsy was not performed. information on the lot/batch number has been requested.; Sender's Comments: Pulmonary edema, low heart rate, and chest pain, all reported as fatal, are deemed unrelated to BNT162B2 vaccine, being rather accidental occurrences, likely favored by the patient's age and by the mentioned high blood pressure, known risk factor for cardiovascular diseases. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Low heart rate; pulmonary edema; chest pain

upon auscultation. CPR and pulse was regained and patient was breathing. Patient sent to Hospital ER were she remained in an unstable condition had multiple cardiac arrest and severe bradycardia and in the end the hospital was unable to bring her back.

SARS-COV-2 TEST NEGATIVE

COVID19 (COVID19 (MODERNA)) (1201)

"Narrative: Patient with severe aphasia and only able to say ""hey, hey, hey"" or ""uh huh"" or shake his head no as a way to communicate. Patient previously able to ambulate with significant limp and hyperextension of right knee, but mostly wheelchair bound over last several years as he had had a slow and steady decline in overall health and mobility. Patient developed aggressive behavior of shouting ""hey"" and grabbing of groin in 2016. This was worked up with CT scans, labs, referral to urology, neurology, and referrals to psychiatry. The exact etiology of this action was never able to be affirmed, but thought to be more psychiatrically related. It improved significantly with addition of antipsychotics, worsened when antipsychotics were reduced, and improved again with addition of injectable antipsychotic on 12-10-2020.Patient suffered from falls on occasion given his significantly impaired physical mobility. His last documented fall was 8-31-2019. Patient began utilizing wheelchair most of time following that fall. No significant injuries noted in documentation of the falls. In the last 3 months, patient would often refuse medications. He would sometimes indicate that they would cause dizziness, and other times he would simply refuse. We attempted to hide medications in his food/fluid (with wife's blessing) and when he detected this he would occasionally refuse to eat. Patient previously on DOAC. After pharmacy review in 12/2020 it was recommended to discontinue this as no clear indication to continue use. He was high fall risk and would often refuse this medication as well since 10/2020. Noted to be in NSR on EKGs and decision made to discontinue the DOAC. Patient had no evidence of adverse effects noted after vaccination on December 28th. Patient seen by provider on the morning of his death (1/4/2021) with no noticeable significant change in health condition. Temperature 36.8Con January 4th at 19:45. During routine bedtime cares, patient suddenly collapsed and death was pronounced January 4, 2021 at 20:05. Autopsy was requested from next of kin and no autopsy was granted. Symptoms: & DEATH Treatment:"

	SARS-COV-2 TEST NEGATIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received Moderna COVID vaccine on 12/30/2020 at a Pharmacy clinic where he was a resident. Nurses at the facility reported that he was responsive and showed no signs of any adverse effects until 1/2/2021 when he was observed slightly unresponsive and staring at the ceiling and trembling. He had a fever of 101F at this time. The facility ordered labs and a rapid COVID test (all of which came back normal) and started IV antibiotics. A few hours later, patient began bleeding from his eyes, nose, and mouth and was sent to the local ER. The patient refused being admitted to the ICU for possible sepsis/hemorrhage and died the following day on 1/3/2021. All healthcare professionals involved agreed that this was not likely due to the vaccine, but needed to be reported nonetheless.		No prior vaccinations for this event.
	SARS-COV-2 TEST NEGATIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
CARDIAC ARREST THAT LEAD TO DEATH - IT WAS REPORTED BY EMS THAT THE PT HAD RECEIVED THE VACCINE ABOUT 30 MINS PRIOR. HE ARRIVED HOME, BECAME SHORT OF BREATH & COLLAPSED. 911 WAS CALLED AND HE WAS TRANSPORTED VIA EMS TO HOSPITAL (16:17) WHERE HE LATER EXPIRED (23:01).		No prior vaccinations for this event.
	SARS-COV-2 TEST NEGATIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient recieved vaccine 1 of covid 19 i 1/19/2021. She felt poorly on 1/20/2021. She felt dizzy and fell at 3 AM on 1/23/2021. She felt poorly and did not know her son's name which was not normal. She went to ER on 1/24. She was assessed as not having fractures. She was going to be transferred to a skilled nursing facility. She was not having respiratory complaints. She was awaiting transfer when her O2 levels started dropping substantially. She declined aggressive intervention and she died within a few hours.		No prior vaccinations for this event.

SARS-COV-2 TEST NEGATIVE		**COVID19 (COVID19 (MODERNA)) (1201)**
UNKNOWN/ASYTOLE Narrative: Please refer to section 6. 68y/o male with h/o severe peripheral vascular disease with previous left AKA 2/3/20, s/p bilateral bypasses in the past. Pt recently underwent right AKA on 1/12/21. Per Hospital remote data 1/10/21 pt c/o shortness of breath, CXR demonstrated right lower lobe opacity & left basilar infiltrate. Pt s/p >10 days emperic IV abx. Moderna vaccine 0.5ml IM was administered via left deltoid on 1/22/21 around 16:21. On 1/23/21@05:14 code blue was called as pt found to be unresponsive, breathless and pulseless, facial cyanosis noted, CPR started immediately.Pt found to be in asystole. ACLS guideline followed but no return of spontaneous circulation, At 05:32 pt remained pulseless and breathless and was pronounced. Autopsy currently pending.		No prior vaccinations for this event.
SARS-COV-2 TEST NEGATIVE		**COVID19 (COVID19 (MODERNA)) (1201)**
Pt started complaining of chest heaviness and shortness of breath on the afternoon of 1/21/21. EMS was called to the patients home and she was found to have an O2 sat in the 70's. She was admitted to hospital and found to have a proBNP of 5000. She tested negative for Covid-19. She was determined to be in acute-on-chronic heart failure and was referred for hospice care. She passed away on the evening of 1/24/21.		No prior vaccinations for this event.
SARS-COV-2 TEST NEGATIVE		**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.		No prior vaccinations for this event.

	SARS-COV-2 TEST NEGATIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
"This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21." COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on

No prior vaccinations for this event.

the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20	No prior vaccinations for this event.

without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending

work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

she was hurting at her chest/ Chest pain; on her left arm hurt real bad that's what the clot on her left arm; on her left arm hurt real bad that's what the clot on her left arm; She passed away; heart attack; This is a spontaneous report from a contactable consumer. An 87-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 19Jan2021 at single dose for COVID-19 immunisation. Medical history included diabetes mellitus, for which she was taking a pill like an hour before she would take her meal. On Monday (Jan2021) the patient experienced was hurting at her chest/ chest pain, her left arm hurt real bad as she had a blockage in her left arm/clot on her left arm, and they wanted to put in a stent and after the surgery it went well and she all go home in two days. The patient was hospitalized in Jan2021 due to the events. She had a heart attack and that the chamber between the dividers had a hole in it and her heart tissue was too thin so much thin she couldn't repair it. The patient passed away on 26Jan2021. The patient was tested negative for COVID-19 on unknown date. Information on the lot/batch number has been requested.; Reported Cause(s) of Death: She passed away		No prior vaccinations for this event.

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

SARS-COV-2 TEST NEGATIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in

No prior vaccinations for this event.

bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

SARS-COV-2 TEST NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient got the injection and quickly developed a fever and felt weak. Family was contacted and he was sent to Hospital.	No prior vaccinations for this event.
SARS-COV-2 TEST NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient	No prior vaccinations for this event.

coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent

with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

Morphine sulfate 20mg/ml, give 2.5mg PO/SL Q4hr PRN pain/shortness of breath. 2/12/2021-Admitted to Hospice, Lethargic, diaphoretic, T 98.1 P 130's R 18 O2 high 80's to low 90's via O2 mask at 3L. 2/12/2021- Resident legs and arms noted to feel cool this afternoon, 02 sat was 97% with 02 on @ 3L with mask Noted resident with sob and increased pulse. Prn morphine 0.25ml sl. given with good effect. Resident was less restless and quiet in her bed. Checked on resident several times this shift for needs. Resident noted to not move in her bed @ 8:15pm and noted she was not breathing. Supervisor called and pronounced resident deceased.

SARS-COV-2 TEST NEGATIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/24/21 Patient Died. 02/23/21. Patient came to ED for weakness/falls. Patient had fallen on 02/21 and 02/23. UA was done in LTC, and he was started on ciprofloxacin 02/22/21. Treatment was to put patient on comfort cares (morphine + lorazepam)

No prior vaccinations for this event.

SARS-COV-2 TEST NEGATIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

[COVID-19 mRNA vaccine (Pfizer-BioNtech] treatment under Emergency Use Authorization (EUA)	No prior vaccinations for this event.
SARS-COV-2 TEST NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
No known side effects; however, on 1/20 the decedent suffered lethargy. On 2/12/2021, the decedent had a possible seizure and was transported to emergency department where shortly after arrival, he was pronounced dead.	No prior vaccinations for this event.
SARS-COV-2 TEST NEGATIVE	**COVID19 (COVID19 (UNKNOWN)) (1202)**
Patient was admitted to hospital from home in cardiac arrest. Hx of hypertension, hyperlipidemia, type 2 diabetes (not on insulin) and bilateral carotid artery stenosis. The patient was reportedly at his baseline health on 2/2/21. He received the 2nd dose of COVID vaccine around 1000AM on 2/2/21. Reportedly started running fever of 100.1 and chills the afternoon of 2/2/21. Around 7:00PM he started having dry cough and was complaining of breathing difficulties. He subsequently vomited multiple times (was eating pizza and aspirated) then lost consciousness. His wife called 911, did CPR and EMS reported he in PEA at scene and was intubated. Transported to hospital. SARS CoV-2 and influenza negative.	No prior vaccinations for this event.
SARS-COV-2 TEST POSITIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
After vaccination, patient tested positive for COVID-19. Patient was very ill and had numerous chronic health issues prior to vaccination. Facility had a number of patients who had already tested positive for COVID-19. Vaccination continued in an effort to prevent this patient from contracting the virus or to mitigate his risk. This was unsuccessful and patient died.	No prior vaccinations for this event.

SARS-COV-2 TEST POSITIVE		**COVID19 (COVID19 (MODERNA)) (1201)**
At the time of vaccination, there was an outbreak of residents who had already tested positive for COVID 19 at the nursing home where patient was a resident. About a week later, patient tested positive for COVID 19. She had a number of chronic, underlying health conditions. The vaccine did not have enough time to prevent COVID 19. There is no evidence that the vaccination caused patient's death. It simply didn't have time to save her life.		No prior vaccinations for this event.
SARS-COV-2 TEST POSITIVE		**COVID19 (COVID19 (MODERNA)) (1201)**
Prior to the administration of the COVID 19 vaccine, the nursing home had an outbreak of COVID-19. Patient was vaccinated and about a week later she tested positive for COVID-19. She had underlying thyroid and diabetes disease. She died as a result of COVID-19 and her underlying health conditions and not as a result of the vaccine.		No prior vaccinations for this event.
SARS-COV-2 TEST POSITIVE		**COVID19 (COVID19 (MODERNA)) (1201)**

Passed away; Positive result; A spontaneous report was received from a consumer concerning a female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed COVID-19 and passed away. The patient's medical history was not provided. Concomitant product use was not reported. On 05 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 08 Jan 2021, the patient had a positive COVID-19 test. On 18 Jan 2021, the patient passed away. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 18 Jan 2021. The cause of death was not reported.; Reporter's Comments: This spontaneous report concerns a female patient who experienced COVID-19 and passed away. The event of COVID-19 occurred 4 days after the first and only dose of the mRNA-1273 vaccine administered and death occurred 14 days after administration of the mRNA-1273 vaccine. Based on the information provided and the known etiology of COVID-19, it is unlikely to be associated with mRNA-1273 vaccine administration. With no definite information on the clinical details of the death, it is difficult to adequately assess a causal association with mRNA vaccine. Main field defaults to		No prior vaccinations for this event.

æpossibly related'; Reported Cause(s) of Death: unknown cause of death

Patient passed away on 2/2/21 after being admitted on 1/31/21 after receiving COVID19 Moderna Vaccine on 1/26/21. On initial report to the hospital patient reported having a cough for over 2 weeks (starting approx. 1/17/21). He had a postive COVID19 PCR on 1/31/21. Intubated on 1/31/21 and passed away on 2/2/21 No prior vaccinations for this event.

SARS-COV-2 TEST POSITIVE		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient described feeling nervous, anxious the next morning (Wednesday) after the vaccine. He later fell in the bathroom after using the restroom, his legs gave out (his words) and consequently was on the ground for 23 hours before being transported to the hospital. That was Thursday afternoon. He was diagnosed with COVID-19 on Saturday night and died the following Friday morning.		No prior vaccinations for this event.
SARS-COV-2 TEST POSITIVE		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡		No prior vaccinations for this event.

enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Resident was vaccinated on 12/31/20. Then on 1/14/21 he tested positive for SARS-CoV-2 on routine surveillance PCR testing. Another resident on the same hall was COVID positive on 1/11/21. Results of the PCR test were obtained on 1/16/21. He appeared asymptomatic at that time. Given his COVID positive status, all aerosol generating procedures had to be stopped. Overnight on 1/16/21 into 1/17/21, he had the onset of acute respiratory failure and was transported to the hospital. Per notes, he was put on BiPAP for several hours, but his CO2 level did not improve. Per prior advance directives completed with the resident and his two brothers, he had DNR/DNI orders. The hospital physician spoke with his brother and the decision was made to move to comfort care. He was discharged to inpatient hospice and died around 4pm on 1/18/21. This outcome does not appear to be vaccine-related, but death from COVID-19 infection is listed as a reportable event following COVID-19 vaccination.

No prior vaccinations for this event.

1/26/21. She demonstrated an SDTI wound to the Lt. heel on 1/27/21. On 1/31/21 she was noted to have a significant weight loss. She was admitted to services on 2/1/21 with comfort care orders. On 2/2/21 she was observed to be without vital signs. Orders were for DNR, and CPR was not initiated in accordance with that order. She was pronounced dead at 0112 on 2/1/21.	this event.
SARS-COV-2 TEST POSITIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending.	No prior vaccinations for this event.

Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

2/13/21 Patient had covid like symptoms 2/15/21 Patient admitted to Hospital with covid like sx and decreased O2 sat; tested positive for Covid on 2/15/21; treated with Remdesivir and convalesent Plasma. Sx worsened and patient died 2/26/21..	No prior vaccinations for this event.
SARS-COV-2 TEST POSITIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric	No prior vaccinations for this event.

treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his

stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12	No prior vaccinations for this event.

admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

SCRATCH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient (now deceased) received 1st dose of Pfizer-BioNTech vaccine around December 21, 2020 and was noticed to be scratching, fatigued, and unresponsive by a family member on December 24, 2020. He received the second dose of the same vaccine around January 22, 2021. Pockmarks and bleeding scratch marks were noted by a family member on the patient's face prior to this second dose. On January 28, 2021 a family member was alerted that the patient was suffering from severe bullous pemphigoid- a skin condition that has never been experienced by the patient, has been reported to be related to COVID-19 viral infection, and to T-cell responses promoted by vaccines. A corticosteroid was given, but did not work. Blisters developed to the point hands had to be dressed.

Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19	No prior vaccinations for this event.

VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat

raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the

expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

	SEPSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.		No prior vaccinations for this event.

Fall; fatigued; arm pain; AML; Sepsis secondary to AML; This is a spontaneous report from a contactable consumer. An 88-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EL3249), via an unspecified route of administration on 19Jan2021 17:30 in right arm at single dose for covid-19 immunization. Medical history included hypertension, hyperlipidemia, OA (osteoarthritis), cognitive impairment. No other vaccine in four weeks was administrated. Concomitant medication in two weeks included atorvastatin, aspirin, calcium, gabapentin, losartan and memantine hydrochloride (NAMENDA). The patient previously took lisinopril and tetracycline and both experienced allergies. The patient had no covid prior vaccination. The patient initially had no symptoms but arm pain in Jan2021, no bleeding or bruising from injection. On 31Jan2021 19:00, patient felt fatigued. Patient suffered fall on 01Feb2021. She was admitted to hospital. All cell lines were down in Feb2021. She was diagnosed with AML (acute myeloid leukemia) in 2021. She expired 07Feb2021. Events resulted in emergency room/department or urgent care, hospitalization, life threatening illness (immediate risk of death from the event) and patient died. The patient received the treatment of blood and platelet transfusions, bone marrow biopsy, cytogenetic testing, antibiotics, intubation for events. The patient died on 07Feb2021 due to sepsis secondary to AML. An autopsy was not performed. Outcome of events were fatal.; Reported Cause(s) of Death: arm pain; fatigued; fall; Sepsis secondary to AML; Sepsis secondary to AML

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. "Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"	No prior vaccinations for this event.

SERUM FERRITIN INCREASED	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a	No prior vaccinations for this event.

possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced

pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

	SERUM FERRITIN INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was tested for covid on 2/2/21 with positive resulted. Presented to Hospital ER on 2/10/21 with c/o of abdominal pain. Diagnosed with gastritis, prescribed metoclopromide and famotidine and dc home. Returned to ER on 2/13/21 with c/o of weakness, diarrhea, foot ulcer, and loss of appetite. Diagnosed: 1) Dyspnea and hypoxia secondary to Covid-19 2) Extensive bilateral lung infiltrates secondary to Covid-19 3) Increased Cr 4) Increased LFTs, ferritin, d-dimer, troponin secondary to Covid-19 5) Elevated procalcitonin placing the patient at high risk for sepsis 6) Chronic appearing Right foot wound without signs of secondary infection Patient transferred to a different hospital in another city.		No prior vaccinations for this event.
	SHIFT TO THE LEFT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from		No prior vaccinations for this event.

facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note:

""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

	SHOCK	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

SINUS TACHYCARDIA

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was

No prior vaccinations for this event.

transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

SINUS TACHYCARDIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On 1/9/2021 observed with elevated respirations of 38-42 per minute, BP manually 72/50. pulse is jumping rapidly between 110-16 bpm. oxygen sat 76% RA, resident refusing oxygen at first attempt, allowed oxygen to be placed, is now 84% on 4L. resident shaking head yes that he is hurting, and yes that he would take medication for pain. Dr. notified, branch block. Received order for morphine 2mg per hr as needed for elevated respirations and pain. Dr. also gave orders to D/C Tamsulosin and finasteride. Resident continue with decreased O2 sats and elevated respirations. Absence of vital signs on 1/10/21 at 826PM.	No prior vaccinations for this event.
SINUSITIS	**COVID19 (COVID19 (MODERNA)) (1201)**

heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on 17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at		No prior vaccinations for this event.

home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

SKIN DISCOLOURATION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2	No prior vaccinations for this event.

high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good

recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

SKIN EXFOLIATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

SKIN WARM	**COVID19 (COVID19 (MODERNA)) (1201)**
death of unknown cause; Swelling on Right side of the neck and under chin; Warmth on right side of neck and under chin; Redness on right side of neck and under chin; A spontaneous report was received from a healthcare professional concerning an 89-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced events of redness, warmth and swelling on right side of neck and under chin, and death of unknown cause. The patient's medical history included Alzheimer's and chronic obstructive pulmonary disease (COPD). No concomitant medications were reported. On 29 Dec 2020, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: Unknown) intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient experienced the events of redness, warmth and swelling on right side of neck and under chin. There was no indication that the patient was transferred out to hospital, which was unlikely because she was under hospice care. On 01 Jan 2021, the patient died due to an unknown cause of death. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2020. The cause of death was not provided. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns a 89-year-old, female subject with a medical history of Alzheimer's and chronic obstructive pulmonary disease	No prior vaccinations for this event.

(COPD) who experienced redness, warmth and swelling on R side of neck and under chin and expired from an unknown cause. The events of redness, warmth and swelling on R side of neck and under chin occurred 2 days after administration of the first and only dose of the mRNA-1273 vaccine and patient expired 4 days after mRNA-1273 vaccine administration. Lot # of the vaccine was not provided. De-challenge and re-challenge are not applicable. The events of redness, warmth and swelling on R side of neck and under chin are temporarily associated with the administration of the mRNA-1273 and thus, a causal relationship cannot be excluded. Due to limited information, the fatal outcome was considered unrelated to mRNA-1273 administration pending additional information. Fatal outcome is confounded by the patient's underlying condition and advanced age.; Reported Cause(s) of Death: Unknown cause of death

SLEEP APNOEA SYNDROME	**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse	No prior vaccinations for this event.
SLOW RESPONSE TO STIMULI	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was	No prior vaccinations for this event.

treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from nursing home staff report.

	SLUGGISHNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Vaccine given on 12/29/20 by Pharmacy. On 1/1/21, resident became lethargic and sluggish and developed a rash on forearms. He was a Hospice recipient and doctor and Hospice ordered no treatment, just to continue to monitor. When no improvement of codition reported, doctor and Hospice ordered comfort meds (Morphine, Ativan, Levsin). Resident expired on 1/4/2021		No prior vaccinations for this event.
	SLUGGISHNESS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
family states seemed short of breath since after the covid vaccine. Staff said beginning on 1/22/21 the patient seemed sluggish, more tired, and nausea noted. She stayed in her room more after the vaccine because worried about giving/getting COVID to others. was talking on the phone at 11:30 PM on 1/26/21 to staff person about temperature of room. at 12:15 AM on 1/27/21 staff noted not breathing, started CPR and called EMS. When EMS arrived they stopped the code because she was too long deceased.		No prior vaccinations for this event.
	SMALL INTESTINAL OBSTRUCTION	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient experienced an episode of emesis and loss of consciousness several hours after vaccine on		No prior vaccinations for

2/16/21. He was taken by EMS to the hospital and was noted to be hypoxic and hypotensive. He was admitted to the hospital and subsequently intubated. He was also found to have a small bowel obstruction and a nasogastric tube was placed to decompress the bowel. He required pressor support as well. He expired on 2/17/21.

this event.

SMALL INTESTINAL OBSTRUCTION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency

"CC:full arrest HPI:HPI and ROS limited due to patient's condition. History is via EMS, medical record, and son. Per Son patient had Covid vaccine on Saturday morning. Slept all day Sunday. Woke up Sunday night a bit ""like coming out of a deep sleep per son, around 10 pm. Shortly after that patient was having a hard time breathing. Emergency called. Arrested around the time EMS arrived. King airway, I/O and CPR initiated. Patient has been in v fib. Was shocked multiple times, given 4 rounds of epi, bicarb and		No prior vaccinations for this event.

amiodarone. ACLS continued on arrival. Multiple rounds of epi, and attempted defib. Patient given epi, bicarb. Rhythms included fine v fib, asystole, and PEA. Unrecoverable with no cardiac motion. Time of death 11:50 pm."

SOMNOLENCE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient noted to have irregular breathing in bed and unable to arouse. Provided life saving measures in the field x 30 minutes and transferred to hospital. Noted to have heart arrhythmia which suspected to cause cardiac arrest.	No prior vaccinations for this event.

SOMNOLENCE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.	No prior vaccinations for this event.

	SPECIFIC GRAVITY URINE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2

	SPEECH DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received vaccine on 1/4/2021. He was in Hospice for CHF and renal failure, but was able to get up in his wheelchair and eat and take medications and talk. On 1/5/2021 am, he was noted to be very lethargic an could only mumble, could not swallow. No localizing neurologic findings. He was too lethargic to get up in chair.		No prior vaccinations for this event.
	SPEECH DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
Staff walked into resident's room around 10:00am and noted resident's left side of his face was flaccid. Nurse was called and upon assessment resident noted to have an unequal hand grasp with left worse. He was able to talk but was mumbled and hard to understand. Physician, hospice, and family were notified. Resident had a stroke at 10:06 am on 1/8/2020. He lost all ability to use his left side. Resident passed away on 1/11/2020.		No prior vaccinations for this event.
	SPEECH DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient obtained initial dose of Moderna vaccine on Thurday, Jan 14. No adverse effects reported during initial 15 minute post vaccine waiting period. Saturday morning (Jan 16), patient developed severe cough, labored breathing, and fever. Additionally patient mental status changed suddenly, became non-communicative (unable to speak, but would scream if she was touched). O2 status was irregular, dropping to 78. Sunday morning, EMT and then hospice was hospice called. Monday morning, after hospice emergency kit was initiated, patient passed away.		No prior vaccinations for this event.

	SPEECH DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
I video chatted with her Thursday after receiving the vaccine. My mom was in poor health but she was talking in complete sentences and responded appropriately. She was upright in bed and made eye contact. She smiled and denied pain. By Sunday, she was extremely weak and unable to sip water with a straw. Her health had changed dramatically and rapidly. She moaned in pain and was very fatigued. Her condition continued to deteriorate over the week and she stopped talking and was constantly sleeping. They started antibiotics for the oozing cancer lesion and then morphine for pain and end of life care. She passed away on January 22nd which was 15 days post vaccination.		No prior vaccinations for this event.
	SPEECH DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
PATIENT GOT HER FIRST COVID PFIZER VACCINE AT 12/31 IN THE AM. HAD GOTTEN FLU LIKE SYMPTOMS AND HAD BEEN SICK FOR A COUPLE OF DAYS. HAD NAUSEA AND VOMITTING DURING THIS TIME AS WELL. ON 1/3 THE CARE GIVER WENT TO CHECK ON HER PT AT HER LTC FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.		No prior vaccinations for this event.
	SPEECH DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Client recevied the COVID-19 vaccine on 1/5/21 by the Vaccine clinic. Client tested positive for COVID-19 by		No prior vaccinations

rapid testing on 1/21/21, with c/o hurting all over and loose stools. She became non-verbal on 1/23/21 with poor intake. On 1/24/21 at 0537 Client was unresponsive and without vital signs. Orders were for DNR, and CPR was not initiated.	for this event.
SPINAL COMPRESSION FRACTURE	**COVID19 (COVID19 (MODERNA)) (1201)**
On 1/23/21 the patient had a single-car accident, slid off icy road into snowbank. She was seen in our ER, diagnosed w/ trauma and L4 compression fracture. She was transported to Hospital for further trauma workup. We believe she was treated and released. On 1/31/21 the patient had a headache but did not seek medical attention. In the morning of 2/1 she became unresponsive and was pronounced dead on the scene when EMS arrived. Autopsy showed a left temporal subdural hematoma.	No prior vaccinations for this event.
SPINAL CORD INJURY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures	No prior vaccinations for this event.

growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

SPINAL FRACTURE	**COVID19 (COVID19 (MODERNA)) (1201)**
"Resident complained of feeling ""hot"" at supper time. Had emesis an hour or so later. Became hypoxic and was transferred to the hospital emergency room. Her evaluation in the ED revealed continued presence of UTI, leukocytosis (19.8), and renal insufficiency (BUN 22 Cr. 1.3) BP 99/63; P 74; Temp 98.1; RR 16; and O2 sat of 95% with 2 LPNC (she is typically on RA). CXR reported changes most consistent with CHF with cardiomegaly and bilateral pulmonary vascular prominence. Bibasilar pleural effusions greater on the right than left with pulmonary edema. Large hiatal hernia and likely old chronic wedge defromities involving the mid thoracic vertebral body. She was admitted for IV antibiotics. She expired 2/6/2021"	No prior vaccinations for this event.
SPINAL MYELOGRAM NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
92 year-old male with PMHx of vascular dementia, BPH, MDD, sleep disturbance , basal cell carcinoma of neck, osteoarthritis, BLE edema, Guillain-Barre syndrome 30 years prior, s/p COVID positive on 1/11/21 and received IV Bamlanivimab. Sent to hospital on 2/2/21 for altered mental status, generalized weakness with	Influenza Vaccine

inability to lift bilateral UE and difficulty moving his BLE. He was treated for UTI with 7 days of Cefepime for Morganella Morganii. He was followed by neurology with MRI of the brain and CT of the spine without acute findings. Lumbar puncture unable to be obtained. He received 5 day course of IVIG for presumed Guillain-Barre . EMG showed generalized sensory motor polyneuropathy both axon loss and demyelinating type severe in degree. However, he did not recover from his GBS symptoms, was transferred back to the nursing home and died on 2/15/2021.	
SPINAL OPERATION	**COVID19 (COVID19 (MODERNA)) (1201)**
death Narrative: unclear of details, s/p spine surgery on 2/2/21 and discharged on 2/6/21	No prior vaccinations for this event.
SPINAL OSTEOARTHRITIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
[COVID-19 Vaccine] treatment under Emergency Use Authorization(EUA): He presented 10 days after first COVID-19 Vaccine with Progressive neurological deficits with bulbar manifestations - dysarthria, dysphagia and bilateral arm weakness and incoordiantion, worse on right. MRI brain was negative for acute stroke and MRI cervical, showed degenerative changes. Transferred from community hospital to tertiary center where the diagnosis was made of AIDP. He was intubated at that time in Neuro ICU. Given Steroids and IVIG but no improvement and was either will need to have Trach and PEG vs CMP and family honored the patient's wishes and made him CMO. signs of severe demyelination and AIDP was diagnosed.	No prior vaccinations for this event.

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to

No prior vaccinations for this event.

urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

SPUTUM DISCOLOURED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/15: Pfizer vaccine dose 1 administered 1/16: Fever, chills 1/22: Sore throat, coughing w/white phlegm, taking Tylenol and Mucinex. Fever and chills from 1/16 subsided. Had telehealth consultation with PA. Per her notes, patient said he gets these symptoms annually, requested for an antibiotic. PA referred him for a COVID test. Ordered hydrocodone/chlorphen ER suspension for his cough and an antibiotic. Antibiotic was recommended if symptoms do not subside. 1/23: COVID test administered 1/25: Reported positive for COVID 1/26: Telehealth session w/PA: she informed patient of his positive test, advised to quarantine and seek medical help at hospital if symptoms worsen. Patient reported that his sore throat mostly subsided but is still coughing at night. Said that the pharmacy didn't receive the prescription order for the antibiotic, so this was re-ordered. 1/31: Partner found him dead at 8:18AM on his bed. Death certificate issued by state says cause of death: COVID. Autopsy was not performed. Buried on 2/9/21.	No prior vaccinations for this event.

STAPHYLOCOCCAL BACTERAEMIA

COVID19 (COVID19 (MODERNA)) (1201)

Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.

No prior vaccinations for this event.

STAPHYLOCOCCAL INFECTION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Day After - severe headache, 2 days after headache continues, itchy scalp, day 3 rash visible at hair line headache continues, more confusion than normal, day 4 on site nurses check rash and think it is dermatitis, day 5 continues to get work nurse practitioner was to visit next day, day 6 NP thinks that she has UTI and sends her to hospital (2/11/21). Hospital determines - Rash is Shingles, UTI present, - MRSA is now present in shingles which is on right back of head and right neck and face. Next Sepsis is diagnosed. Since 2/11/21 patient was not conscious. 2/20/21 famiy is notified that she should be moved to Hospice. Moved to hospice on 2/20/21. The patient, my mother, died on 2/23/21 official cause of death is UTI.

STENT PLACEMENT

COVID19 (COVID19 (MODERNA)) (1201)

Approximately 2 weeks after the first COVID vaccine she developed shortness of breath that was much more significant than she had previously. This was the first time she had expressed this symptom to me as being something she was concerned about and difficult for her to manage (we have spoken almost daily for many years). Within 24 hours of the second dose of the mRNA vaccine, they called an ambulance to get her and she was taken to the hospital and diagnosed with bacterial pneumonia. The doctors said it was unrelated, but I found a study with a different vaccine (LAIV) that also seemed to increase the incidence of bacterial pneumonia. They hypothesized through diverting the immune system. So while I don't think the vaccine gave her the bacteria, I do think it may have caused her immune system to be temporarily compromised allowing the bacteria to grow out of control. I feel this is important to report to look for these types of patterns as perhaps it can help others avoid the death spiral that happened to my mother. There were also intervening events between her hospitalization and her death including two successful surgeries (one for a broken hip and another to put in stents in her leg). So to summarize, the first vaccine was within about 2 weeks of the onset of her breathing problems. Within 24 hours of the second vaccine she was hospitalized and diagnosed with bacterial pneumonia. As she was battling bacterial pneumonia in the hospital she broke her hip and was found to have reduced peripheral circulation and had 2 surgeries to correct those. They were successful according to the surgeons, however she died within a week or so of the surgeries. She had other comorbidities as well which I'm sure predisposed her such as diabetes, hypertension and cancer for many years.

Breathing issues ~2 weeks after first dose of mRNA vaccine in the series but were not nearly as acute or severe as they were fol

STENT PLACEMENT

COVID19 (COVID19 (PFIZER-

	BIONTECH)) (1200)
she was hurting at her chest/ Chest pain; on her left arm hurt real bad that's what the clot on her left arm; on her left arm hurt real bad that's what the clot on her left arm; She passed away; heart attack; This is a spontaneous report from a contactable consumer. An 87-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 19Jan2021 at single dose for COVID-19 immunisation. Medical history included diabetes mellitus, for which she was taking a pill like an hour before she would take her meal. On Monday (Jan2021) the patient experienced was hurting at her chest/ chest pain, her left arm hurt real bad as she had a blockage in her left arm/clot on her left arm, and they wanted to put in a stent and after the surgery it went well and she all go home in two days. The patient was hospitalized in Jan2021 due to the events. She had a heart attack and that the chamber between the dividers had a hole in it and her heart tissue was too thin so much thin she couldn't repair it. The patient passed away on 26Jan2021. The patient was tested negative for COVID-19 on unknown date. Information on the lot/batch number has been requested.; Reported Cause(s) of Death: She passed away	No prior vaccinations for this event.
STREPTOCOCCUS TEST NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.	No prior vaccinations for this event.
STREPTOCOCCUS TEST POSITIVE	**COVID19 (COVID19**

(MODERNA)) (1201)

Pt. presented to the ER with abd pain and septic shock. Pt. reported to feel ill shortly after receiving the vaccine.

SUBARACHNOID HAEMORRHAGE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

No prior vaccinations for this event.

SUBARACHNOID HAEMORRHAGE

COVID19 (COVID19 (UNKNOWN)) (1202)

5 days after receiving his COVID vaccination the patient had a spontaneous (nontraumatic) subarachnoid hemorrhage which was fatal. The patient had previously been stable on his coumadin dosing with therapeutic INRs for the past several months per his wife. At time of presentation his blood pressure in the ER was elevated to 223/94 and his INR was risen to 3.1

No prior vaccinations for this event.

SUBDURAL HAEMATOMA

COVID19 (COVID19 (MODERNA)) (1201)

on 1/13/2021 at 3:40am Cliff called for assistance. He lost his balance and had fallen. Cliff refused vitals, refused emergency department, denied hitting his head. As the day progressed patient developed a headache, diarrhea, and vomiting. He again declined the offer for the emergency room. At supper time wife and staff found Cliff unresponsive, 911 was called and he was taken to the emergency department. The ER did a CT scan and found an acute subdural hematoma. Patient was placed on comfort cares and expired at 3pm on 01/14/2021. Cliff did not have a history of falls.

Influenza vaccine 10/06/2020, age 88, fever, chills, vomiting, malaise

SUBDURAL HAEMATOMA

COVID19 (COVID19 (MODERNA)) (1201)

On 1/23/21 the patient had a single-car accident, slid off icy road into snowbank. She was seen in our ER, diagnosed w/ trauma and L4 compression fracture. She was transported to Hospital for further trauma workup. We believe she was treated and released. On 1/31/21 the patient had a headache but did not seek medical attention. In the morning of 2/1 she became unresponsive and was pronounced dead on the scene when EMS arrived. Autopsy showed a left temporal subdural hematoma.

No prior vaccinations for this event.

SUBDURAL HAEMATOMA

COVID19 (COVID19

	(MODERNA)) (1201)
Patient presented to emergency room on 2/1/2021 with a chief complaint of having a chronic headache and fatigue following receipt of the Moderna vaccine 10 days prior. Following examination by the physician, the patient was diagnosed with an acute subdural hematoma. The patient subsequently underwent decompressive surgery, however demonstrated worsening neurologic status over the next several days and ultimately expired on 2/4/2021.	No prior vaccinations for this event.
SUBDURAL HAEMORRHAGE	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient family had been noticing onset confusion for a few weeks prior to vaccine and event. Patient was taken to ED when found unconscious and died of a subdural hemorrhage a few days after vaccine clinic at retirement home.	No prior vaccinations for this event.
SUBDURAL HAEMORRHAGE	**COVID19 (COVID19 (MODERNA)) (1201)**
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021	No prior vaccinations for this event.
SUBDURAL HAEMORRHAGE	**COVID19 (COVID19**

SUDDEN DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Since I was not with my husband I can only tell you what was told to me. He walked out of the store toward our car. Someone watched him, concerned, because he was walking very slowly (normally has a slow gait because of leg braces and toe amputations so I don't know if it was unusually slow). The woman saw him fall and she ran to help-administered CPR immediately-and told me he died instantly. Medics tried to resuscitate and failed to bring a pulse. (My husband left our home around 11:15 to drop a package off at store. The store is one mile from our home. At around 12:30 a deputy came to my door and when I saw him my knees buckled. I knew something horrible happened.

SUDDEN DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was

No prior vaccinations

transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.		for this event.

SULPHUR DIOXIDE TEST **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P No prior vaccinations for this event.

67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

SUPRAVENTRICULAR TACHYCARDIA

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

On 1/9/2021 observed with elevated respirations of 38-42 per minute, BP manually 72/50. pulse is jumping rapidly between 110-16 bpm. oxygen sat 76% RA, resident refusing oxygen at first attempt, allowed oxygen to be placed, is now 84% on 4L. resident shaking head yes that he is hurting, and yes that he would take medication for pain. Dr. notified, branch block. Received order for morphine 2mg per hr as needed for elevated respirations and pain. Dr. also gave orders to D/C Tamsulosin and finasteride. Resident continue with decreased O2 sats and elevated respirations. Absence of vital signs on 1/10/21 at 826PM.

No prior vaccinations for this event.

SUPRAVENTRICULAR TACHYCARDIA

COVID19 (COVID19 (PFIZER-BIONTECH))

(1200)

"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."

fatigue following receipt of the Moderna vaccine 10 days prior. Following examination by the physician, the patient was diagnosed with an acute subdural hematoma. The patient subsequently underwent decompressive surgery, however demonstrated worsening neurologic status over the next several days and ultimately expired on 2/4/2021.

for this event.

SURGERY

COVID19 (COVID19 (MODERNA)) (1201)

Approximately 2 weeks after the first COVID vaccine she developed shortness of breath that was much more significant than she had previously. This was the first time she had expressed this symptom to me as being something she was concerned about and difficult for her to manage (we have spoken almost daily for many years). Within 24 hours of the second dose of the mRNA vaccine, they called an ambulance to get her and she was taken to the hospital and diagnosed with bacterial pneumonia. The doctors said it was unrelated, but I found a study with a different vaccine (LAIV) that also seemed to increase the incidence of bacterial pneumonia. They hypothesized through diverting the immune system. So while I don't think the vaccine gave her the bacteria, I do think it may have caused her immune system to be temporarily compromised allowing the bacteria to grow out of control. I feel this is important to report to look for these types of patterns as perhaps it can help others avoid the death spiral that happened to my mother. There were also intervening events between her hospitalization and her death including two successful surgeries (one for a broken hip and another to put in stents in her leg). So to summarize, the first vaccine was within about 2 weeks of the onset of her breathing problems. Within 24 hours of the second vaccine she was hospitalized and diagnosed with bacterial pneumonia. As she was battling bacterial pneumonia in the hospital she broke her hip and was found to have reduced peripheral circulation and had 2 surgeries to correct those. They were successful according to the surgeons, however she died within a week or so of the surgeries. She had other comorbidities as well which I'm sure

Breathing issues ~2 weeks after first dose of mRNA vaccine in the series but were not nearly as acute or severe as they were fol

predisposed her such as diabetes, hypertension and cancer for many years.

SURGERY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Received Pfizer Covid Vaccine in the AM on 2/9/21. Arrived to emergency department later the same day complaining of nausea, weakness, fatigue, Vomiting, Diarrhea. Post operative diagnosis, Ischemic colon/toxic megacolon.	No prior vaccinations for this event.

SURGERY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
After the second vaccine dose she reported not feeling well with unspecified symptoms for a few days. On February 18th, 2021 she visited her doctor with numbness in her hand. They thought it may be carpal tunnel and sent her home. The morning or March 18th , 2021 she had a severe stroke and was transferred to Hospital and then to other hospital. She was in the hospital until Tuesday March 23rd when she was transferred back to her home for hospice care. She died on March 26th, 2021.	No prior vaccinations for this event.

SUTURE INSERTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
L hand edema, hematoma which burst and caused bleeding sending pt to the ER for pressure dressing and 2 stitches. L hand and arm progressively got more edematous and bruised looking (severely black/blue/purple) and the hand continued to bleed and swell on 2/6/21. Severe arterial and venous issues and apparent blood clots. On 2/7/21 there were also lumps noted on left inner thigh. Pt. stopped eating or drinking on 2/8/21 and expired on 2/12/21.	No prior vaccinations for this event.

SWELLING	COVID19 (COVID19 (MODERNA)) (1201)
death of unknown cause; Swelling on Right side of the neck and under chin; Warmth on right side of neck and under chin; Redness on right side of neck and under chin; A spontaneous report was received from a healthcare professional concerning an 89-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced events of redness, warmth and swelling on right side of neck and under chin, and death of unknown cause. The patient's medical history included Alzheimer's and chronic obstructive pulmonary disease (COPD). No concomitant medications were reported. On 29 Dec 2020, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: Unknown) intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient experienced the events of redness, warmth and swelling on right side of neck and under chin. There was no indication that the patient was transferred out to hospital, which was unlikely because she was under hospice care. On 01 Jan 2021, the patient died due to an unknown cause of death. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2020. The cause of death was not provided. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns a 89-year-old, female subject with a medical history of Alzheimer's and chronic obstructive pulmonary disease (COPD) who experienced redness, warmth and swelling on R side of neck and under chin and expired from an unknown cause. The events of redness, warmth and swelling on R side of neck and under chin occurred 2 days after administration of the first and only dose of the mRNA-1273 vaccine and patient expired 4 days after mRNA-1273 vaccine administration. Lot # of the vaccine was not provided. De-challenge and re-challenge are not applicable. The events of redness, warmth and swelling on R side of neck and under chin are temporarily associated with the administration of the mRNA-1273 and thus, a causal relationship cannot be excluded. Due to limited information, the fatal outcome was considered unrelated to mRNA-1273 administration pending additional information. Fatal outcome is confounded by the patient's underlying condition and advanced age.; Reported Cause(s) of Death: Unknown cause of death	No prior vaccinations for this event.

	SWELLING	**COVID19 (COVID19 (MODERNA)) (1201)**

itchy skin, swelling, disorientation that led to a fall No prior vaccinations for this event.

	SWELLING	**COVID19 (COVID19 (MODERNA)) (1201)**
Passed away; tired; nonresponsive; cold; difficulty breathing; swelling; sore arm; feeling weird and funny; A spontaneous report (United States) was received from a consumer concerning a 63 year old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and the patient experienced limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal and the patient passed away . Medical history included treatment for tuberculosis and dialysis. Concomitant medication included calcium acetate, Renvela, glipizide, omeprazole, aspirin, vitamin D, losartan, furosemide, rifampin, and Sensipar. On 14 Jan 2021, the patient received the first of their first planned doses of mRNA-1273 (lot number 030L20A) for prophylaxis of COVID-19 infection. On 13 Jan2021, the patient tested negative for COVID-19). On 16 Jan 2021, the patient experienced a sore arm, and feeling weird/funny. On 17Jan2021, the patient experienced difficulty breathing and swelling. On 18 Jan 2021, the patient declined dialysis, was tired and wanted to lay down. At 8 am, the patient was found nonresponsive and cold and is believed to have passed away around 4 am. The coroner tested the deceased for COVID-19 and the test was positive. No autopsy was reported. No death certificate was issued at the time of the report but the reporter believes it will list cause of death as COVID complications. Action taken with the mRNA-1273 was not applicable. The outcome of the events of limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal, was fatal. On 18 Jan 2021, the patient was died. Cause of death was COVID-19. Autopsy details were not provided.; Reporter's Comments: The events developed on four days after first dose of mRNA-1372. Dyspnea, unresponsive to stimuli, and death were consistent with infection in pandemic set up confounded by age of patient and refusal of dialysis Cause of death was reported as COVID-19. Autopsy details were not provided. Based on reporter's causality the events are assessed as unlikely related to mRNA-1273.; Reported Cause(s) of Death: COVID-19	No prior vaccinations for this event.

SWELLING FACE		**COVID19 (COVID19 (MODERNA)) (1201)**
Resident expired on 2/5/21 at 03:35pm, about 25 hours after second dose of vaccine. At breakfast, resident was spitting a lot of secretions, coughing up liquids from nose and phlegm, facial swelling, which were all symptoms that he was struggling with prior to both doses of COVID vaccine, but had increased more than prior incidences on 2/5/21. Gurgling noted in upper airways, hyscolamine given, bath given to loosen secretions, morphine given. Family notified and came into facility for compassionate care visit around 1300. 1400 HR was 3 and RR was 2, but increased back to 60 and 12 within 20 minutes. Then resident expired at 1535.	No prior vaccinations for this event.	
SWELLING FACE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient had swelling around her jaw after her second shot of the covid , Pfizer vaccine (.5 ml IM) on the Friday morning, January 29th, I took her to a follow up appointment with the cardiologist at 3:00 pm, as a follow up to a small heart attack event with hospitalization two weeks previously, at the cardiologist she was given the ok/all is well. That next morning early, she had a 911 event at her assisted living apartment and was sent back to the hospital, having had another heart attack. Patient died on the following Thursday, February 4, 2021. I do not know if the vaccination had any cause for my mothers death; but I feel it is necessary to report this series of heart attacks after she received the pfizer vaccine. Her Certificate of Death records the cause of death as ""Coronary Artery Disease""."	No prior vaccinations for this event.

"Narrative: Patient with severe aphasia and only able to say ""hey, hey, hey"" or ""uh huh"" or shake his head no as a way to communicate. Patient previously able to ambulate with significant limp and hyperextension of right knee, but mostly wheelchair bound over last several years as he had had a slow and steady decline in overall health and mobility. Patient developed aggressive behavior of shouting ""hey"" and grabbing of groin in 2016. This was worked up with CT scans, labs, referral to urology, neurology, and referrals to psychiatry. The exact etiology of this action was never able to be affirmed, but thought to be more psychiatrically related. It improved significantly with addition of antipsychotics, worsened when antipsychotics were reduced, and improved again with addition of injectable antipsychotic on 12-10-2020.Patient suffered from falls on occasion given his significantly impaired physical mobility. His last documented fall was 8-31-2019. Patient began utilizing wheelchair most of time following that fall. No significant injuries noted in documentation of the falls. In the last 3 months, patient would often refuse medications. He would sometimes indicate that they would cause dizziness, and other times he would simply refuse. We attempted to hide medications in his food/fluid (with wife's blessing) and when he detected this he would occasionally refuse to eat. Patient previously on DOAC. After pharmacy review in 12/2020 it was recommended to discontinue this as no clear indication to continue use. He was high fall risk and would often refuse this medication as well since 10/2020. Noted to be in NSR on EKGs and decision made to discontinue the DOAC. Patient had no evidence of adverse effects noted after vaccination on December 28th. Patient seen by provider on the morning of his death (1/4/2021) with no noticeable significant change in health condition. Temperature 36.8Con January 4th at 19:45. During routine bedtime cares, patient suddenly collapsed and death was pronounced January 4, 2021 at 20:05. Autopsy was requested from next of kin and no autopsy was granted. Symptoms: & DEATH Treatment:"

My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.	No prior vaccinations for this event.

"Patient expired. Per Emergency MD note: ""This is a 72-year-old male with what sounds like diabetes, atrial fibrillation, and hypertension who presents via EMS in cardiac arrest. It sounds like he received his Covid vaccine last week. Initially he had some mild effects from it. However over the last day or so he has felt very unwell. He apparently called his wife today and told her that he was not feeling well and so she returned home. Shortly thereafter he attempted to get up from his chair. He then collapsed and fell forward onto his face. Sounds like his wife had some difficulty rolling him over to perform CPR. When EMS arrived they found him in PEA. He received a total of 5 rounds of epinephrine. At some point they did have return of spontaneous circulation. However just prior to arriving in the emergency department they lost pulses again. The patient was intubated with an 8 oh endotracheal tube prior to arrival."""		No prior vaccinations for this event.

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious,		No prior vaccinations for this event.

but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

TACHYCARDIA

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under	No prior vaccinations for this event.

investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory

failure"""

	he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent	No prior vaccinations for this event.

care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

TACHYPNOEA

COVID19 (COVID19 (MODERNA)) (1201)

This patient has been under hospice care for over 2 years at the nursing home. She has had a steady decline with gradual weight loss. She was totally dependent in her care needs. She received the vaccine on 1/2/2021 as part of the facility vaccination campaign. No adverse events noted initially. On 1/3/2021 at 6:06 pm, she was noted on vital sign checks (done every 4 hours for first 72 hours after vaccination) with BP 64/52 but otherwise asymptomatic. Subsequent BP improved. On 1/4/2021 at 4:45 am, pt found with respiratory rate of 30 with otherwise normal vital signs. Tachypnea persisted, so she received liquid morphine 2.5 mg without improvement. Supplemental oxygen was applied. Tachypnea persisted. She had poor oral intake after that point had persistent tachypnea and worsening hypoxemia despite clear lungs on exam. She remained under hospice care and comfort measures were continued. No blood testing or imaging tests were done. She required increasing amounts of oxygen, became hypotensive, and died peacefully on 1/8/2021 at 7:45 pm.

No prior vaccinations for this event.

	TACHYPNOEA	**COVID19 (COVID19 (MODERNA)) (1201)**
Moderna Vaccine Lot 029K20A Patient received second dose of vaccine on 2/2/21. Within 30 minutes patient had a near syncopal episode. She felt lightheaded and shortly after had episode of nonbloody vomiting. Hypotensive 81/69 and started on levophed. Alert and orientated. Lungs clear, abdomen benign on admission. Patient had no reaction when received first dose of the vaccine. Patient developed worsening shortness of breath, tachypnea, Afib with RVR, hypotension and required intubation and multiple pressors. She is a resident from town. She was sent for hypotension with a blood pressure of 90/52, tachypnea respirations of 54, possible aspiration pneumonia. Status post Covid vaccine earlier today. History is limited as patient is nonverbal on my exam. Death within 24 hours of vaccination		No prior vaccinations for this event.
	TACHYPNOEA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no		No prior vaccinations for this event.

hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50.

Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

TASTE DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.	No prior vaccinations for this event.
TENDERNESS	**COVID19 (COVID19 (MODERNA)) (1201)**
Mentation has declined since hospital discharger for fall on 2/6/20201. Patient has also had significant poor oral intake. Brought in due to apneic episodes. Abdominal pain - diffuse tenderness (right sided) Elevated liver enzymes - likely secondary to dehydration Increased serum creatine kinase - likely due to dehydration	No prior vaccinations for this event.
TERMINAL STATE	**COVID19 (COVID19 (MODERNA)) (1201)**
Hypoxia, Decreased responsiveness, Narrative: 86yo male with PMHx HTN, Afib not on AC after head trauma, CVA, and colon cancer who was brought to the ED by his family on 2/17. Per documentation the pt	No prior vaccinations for

was in his usual state of health until 2/16. Received Moderna covid vaccine #2 on 2/16/21 at 0900, and was this event.
monitored for 15 minutes following immunization no noted issues. Later that night, had myalgias and took Tylenol. Per the family he slipped on the ice and fell on his butt. Overnight, had several dark stools and vomitus. was brought to the ED by his family because he was being less responsive. Pt arrived to the emergency department in extremis. No pulse identified. CPR immediately initiated for several rounds lasting about 25-30 minutes. ROSC unable to be achieved. Patient expired on 2/17 at 1941. Of note, per previous documentation had waxing and waning mental status at baseline. No symptoms noted with 1st dose of Moderna vaccine, which was administered on 1/16/21.

TERMINAL STATE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Death - Hospice patient with metastatic CA admitted to facility and received vaccine during stay. No adverse sequelae noted from vaccine administration, but reporting as required because pt died 7 days later. Narrative: Reporting this event because patient died 7 days after receiving vaccine in the facility where he was in hospice care for metastatic cancer. Vaccine was administered by protocol without complications. The patient had been asked and denied any prior severe reaction to this vaccine or its components and gave permission to receive it. No vaccine adverse sequelae were documented after the immunization as monitored for 15 minutes nor in facility notes for 7 days after the immunization. The patient's death was felt to be due to underlying terminal illness.

No prior vaccinations for this event.

THROAT CLEARING

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"vomiting x3 1/8/21 1/9/21 00:34 - called to resident room by CNAs, staff stated resident was ""different"". Vitals taken and 02 sat was low, O2 in room and applied via NC @3L, O2 sat returned to 98 and all other

No prior vaccinations for this event.

vitals WNL including BS. Resident asked how he felt, stated he felt ""okay"". Resident exhibiting some shakey movements and clearing throat, states he does not have any phlegm or drainage or trouble swallowing. MD called and updated on situation, voicemail left. 1/9/21 11am- resident has been making a ""growling"" noise this shift. resident also has tremors. resident alert and answers questions appropriately. when asked if resident wants to go to hospital, resident firmly states ""no"". vitals wnl. no emesis noted. will continue to monitor resident. 1/9/21 12p- resident not answering questions appropriately. resident only answering yes or no. resident cannot tell me name, or the year, resident cannot state where he is currently or birthdate."

THROMBECTOMY	**COVID19 (COVID19 (MODERNA)) (1201)**
On 1/17/2021 patient woke and began her day as usual, was found down by family member 1 hour later conscious but unable to speak and unable to move her R side. She was admitted to the hospital - Initial NIHSS was 26 and CT imaging showed no acute hemorrhage but mild hypodensity of greater than 1/3 of the MCA territory (TPA not recommended). CTA did show distal L M1/M2 occulsion and she was transferred to larger facility for thrombectomy. Unfortunately the patient had persistent severe neurological deficits after thrombectomy. Was discharged home on hospice care and expired on 1/23/21.	No prior vaccinations for this event.
THROMBECTOMY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
After the second vaccine dose she reported not feeling well with unspecified symptoms for a few days. On February 18th, 2021 she visited her doctor with numbness in her hand. They thought it may be carpal tunnel and sent her home. The morning or March 18th , 2021 she had a severe stroke and was transferred to Hospital and then to other hospital. She was in the hospital until Tuesday March 23rd when she was transferred back to her home for hospice care. She died on March 26th, 2021.	No prior vaccinations for this event.

THROMBOCYTOPENIA		**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine administered 02/08/2021 , by Thursday 02/11/2021 patient almost nonverbal, by Monday 02/15/2021 patient went to the hospital with bruising, sores on her stomach and clots reported as thrombocytopenia, deceased by Friday 02/19/2021.		No prior vaccinations for this event.

continued to decline. Patient expired on 2/14/21.

	THYROID FUNCTION TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.		No prior vaccinations for this event.

	TISSUE INJURY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient tested positive for COVID-19 on 1/8/21. She demonstrated a decline in appetite and the ability to feed herself d/t this illness, but no respiratory or other symptoms. She received COVID-19 vaccine #2 on 1/26/21. She demonstrated an SDTI wound to the Lt. heel on 1/27/21. On 1/31/21 she was noted to have a significant weight loss. She was admitted to services on 2/1/21 with comfort care orders. On 2/2/21 she was observed to be without vital signs. Orders were for DNR, and CPR was not initiated in accordance with that order. She was pronounced dead at 0112 on 2/1/21.		No prior vaccinations for this event.

	TOOTHACHE	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient went home around 11 am on 1-31-21 after her vaccine and 15 minute observation period. She was eating breakfast after at home and complained to a neighbor that her teeth hurt and she was		No prior vaccinations for

nauseated after eating. In the afternoon, she felt dizzy and had diarrhea accompanied with blood. Close to 9 PM, her son went to check on her. The patient was found on the floor--she was unresponsive and had purple lips. Her son called an ambulance and started chest compressions. The patient passed away at the hospital. The doctor has ordered an autopsy, and the results are pending.		this event.
	TOXIC EPIDERMAL NECROLYSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Presented from clinic with 3-4 days of extensive rash. There were multiple areas of skin sloughing on bilateral upper extremities and abdominal wall.		No prior vaccinations for this event.
	TOXICOLOGIC TEST	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received COVID-19 (Moderna) vaccine from the Health Department on afternoon of January 8, 2021 and went to sleep approximately 2300 that night. Was found unresponsive in bed the following morning and pronounced dead at 1336 on January 9, 2021		No prior vaccinations for this event.
	TOXICOLOGIC TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
No symptoms or signs on the day 1st dose of vaccine was received (2/11/2021). 3 days later, (2/14/2021) patient experienced chills for approximately 6 hours, followed by severe (visible) chest spasms, and then cardiac arrest. 911 was called upon witnessing chest spasms, but cardiac arrest/death occurred before patient could be transported to the hospital.		No prior vaccinations for this event.

TOXICOLOGIC TEST NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN

No prior vaccinations for this event.

- CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

TRACHEAL ASPIRATE CULTURE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis.

No prior vaccinations for this event.

Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

TRANSFUSION		**COVID19 (COVID19 (MODERNA)) (1201)**
pt received vaccine on 2/3. early on 2/4 developed chest pain, dyspnea, and was seen in ED and diagnosed with acute exacerbation of CHF and NSTEMI type 2, and anemia. on 2/5 transfusion was started and pt developed worsening dyspnea and then PEA arrest. Pt achieved ROSC and was transferred to the cardiac intensive care unit where he required vasopressor support. he subsequently declined and died on 2/7		No prior vaccinations for this event.
TRANSFUSION		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom only had site soreness after her covid vaccine on 1/21 which resolved within a couple days. However, she died in the early morning hours of 1/25, she was fine the day before, no sign of injury. We found her collapsed on the ground and although we tried cpr she was already dead. She had gone to the hospital on 12/28 for shortness of breath, angina and symptomatic anemia, her ekg was unchanged and		No prior vaccinations for this event.

blood work normal except for anemia. The cardiologist did not think a cardiac cath was needed. Her shortness of breath improved with a blood transfusion and a dose of lasix (no heart failure).

	TRANSFUSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."		No prior vaccinations for this event.

	Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a	No prior vaccinations for this event.

serious event of death among others, 2 days after receiving mRNA- 1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was	No prior vaccinations for this event.

added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

"This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was	No prior vaccinations for this event.

admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21."

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2

No prior vaccinations for this event.

42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was

pronounced at 2123 on 2/20/2021. Children were at bedside.

TYPE 2 DIABETES MELLITUS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient with history advanced vascular dementia, hypertensive cerebrovascular disease and stroke, T2DM. Received her second dose of Pfizer COVID-19 vaccine at approximately 14:00 and was reported to have expired at home at 20:55. Dr. (Medical Director) spoke with patient's son/caregiver 2/4/21. Son reports that patient was in her usual health yesterday morning, deemed well enough by son to travel for vaccination. He reports she had no bothersome symptoms after either first or second vaccinations. Specifically denied rash, wheeze, and difficulty breathing. Son was with patient throughout the day. In the evening, when preparing for bed, he noted she became suddenly unresponsive in a similar fashion as she has done several times in past years. While in all previous such episodes she recovered within minutes, last evening she did not regain consciousness, experiences a brief period of labored breathing, and died. Patient's son called 911 and the patient's body was brought to the medical examiners. The medical examiner declined to proceed with autopsy. Patient's son is not interested in autopsy. Patient's son reports confidence that his mother's underlying hypertensive/diabetic cardiovascular disease is the natural cause of her death. Other Relevant Hx: Symptoms: & Death Treatment:	No prior vaccinations for this event.
ULTRASOUND ABDOMEN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Patient woke apx 0200 complaining of nausea to group home staff. Vitals were checked at that time and WNL. Patient went back to bed. When staff went to wake patient apx 0530, he was unresponsive and had no pulse. Chest compressions were started and EMS called.	No prior vaccinations for this event.
UNRESPONSIVE TO STIMULI	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received her first dose of the Moderna COVID-19 Vaccination on Saturday January 16th 2021 at approximately 12pm. She completed all necessary screening forms and was deemed to be at low risk for serious allergic reactions. She tolerated the vaccination well, and no complications or immediate adverse events occurred. She was observed for a full 15 mins per CDPHE/CDC guidelines and left the Clinic in stable condition after her observation period was complete. On the morning of Tuesday, January 19th, 2021, the patient was found unconscious and unresponsive by her husband. She was transferred by Ambulance to Hospital shortly thereafter. She was diagnosed with a brain bleed that was determined to be inoperable. She was transferred to other Hospital for higher level care. She was seen by neurosurgery and diagnosed with a ruptured aneurysm. She was treated in the ICU for 24 hours, at which point her team determined that the severity of her brain bleed would not respond to treatment. Supportive cares were withdrawn on Wednesday	No prior vaccinations for this event.

Jan 20th, and she passed away shortly thereafter.

Passed away; tired; nonresponsive; cold; difficulty breathing; swelling; sore arm; feeling weird and funny; A spontaneous report (United States) was received from a consumer concerning a 63 year old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and the patient experienced limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal and the patient passed away . Medical history included treatment for tuberculosis and dialysis. Concomitant medication included calcium acetate, Renvela, glipizide, omeprazole, aspirin, vitamin D, losartan, furosemide, rifampin, and Sensipar. On 14 Jan 2021, the patient received the first of their first planned doses of mRNA-1273 (lot number 030L20A) for prophylaxis of COVID-19 infection. On 13 Jan2021, the patient tested negative for COVID-19). On 16 Jan 2021, the patient experienced a sore arm, and feeling weird/funny. On 17Jan2021, the patient experienced difficulty breathing and swelling. On 18 Jan 2021, the patient declined dialysis, was tired and wanted to lay down. At 8 am, the patient was found nonresponsive and cold and is believed to have passed away around 4 am. The coroner tested the deceased for COVID-19 and the test was positive. No autopsy was reported. No death certificate was issued at the time of the report but the reporter believes it will list cause of death as COVID complications. Action taken with the mRNA-1273 was not applicable. The	No prior vaccinations for this event.

outcome of the events of limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal, was fatal. On 18 Jan 2021, the patient was died. Cause of death was COVID-19. Autopsy details were not provided.; Reporter's Comments: The events developed on four days after first dose of mRNA-1372. Dyspnea, unresponsive to stimuli, and death were consistent with infection in pandemic set up confounded by age of patient and refusal of dialysis Cause of death was reported as COVID-19. Autopsy details were not provided. Based on reporter's causality the events are assessed as unlikely related to mRNA-1273.; Reported Cause(s) of Death: COVID-19

COVID19 (COVID19 (MODERNA)) (1201)

"The patient came to the Emergency Room at approx 3:30 am on 02/03/2021 with pain in right arm (same arm the COVID vaccine had been administered in approx 12 hours earlier) and feeling generally unwell. Patient was concerned about possibility of gout flare or that something was wrong with her arm. Elevated blood pressure was noted; this was attributed to anxiety. She was evaluated, given 500 mg Tylenol, and discharged since the pain was decreasing and blood pressure was stabilized. Patient instructed to follow-up with physician. The next day, on 02/04/2021, the patient arrived at the Emergency Room by ambulance; cardiac arrest was the chief complaint. The patient's daughter stated the patient had been ""feeling generally poor and then suddenly collapsed."" Daughter described ""gurgling respirations"" and being unresponsive. 911 was called, police arrived within 5 minutes and initiated CPR. Epinephrine, atropine, lidocaine and bicarb administered after arrival to Emergency Room. Shockable rhythm never demonstrated. Patient never recovered spontaneous respiration or movement. The death was called at 23:04. Coronary artery disease with cardiac arrest is the cause from the ER records; the coroner is putting COVID-19 vaccination in Part 1 of the death certificate."

COVID19 (COVID19 (MODERNA)) (1201)

Per ED note: Brought in ED by EMS at 1945 for acute shortness of breath and hypotension. Patient was placed on supplemental oxygen and covid test completed. Patient was placed on BiPAP to maintain oxygen greater than 90%. Found to be in metabolic acidosis. Patient became unresponsive and pulse could not be palpated. Chest compressions were initiated. ACLS medications given and pulses regained. Patient lost pulse 30 mins later and never regained pulse. Per ED noted; likely developed a PE. Passed away at 2127

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He		No prior vaccinations for this event.

was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

No pulse and no heart beat; couldn't wake him up; passed away; A spontaneous report was received from a daughter concerning a 84-year old, male patient who received Moderna's COVID-19 Vaccine (mRNA-1273) experienced no pulse or heartbeat, couldn't wake him up and passed away. The patient's medical history, as provided by the reporter, included high blood pressure and prostate cancer. No relevant concomitant medications were reported. On 19 Jan 2021, the patient had a blood pressure reading of 133/84 at a cardiology visit. On 13 Feb 2021, approximately 3 hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (batch number 031M20A) intramuscularly for prophylaxis of COVID-19 infection. On 13 Feb 2021 at 3:30 pm, the patient could not be woken up and was found with no pulse or heartbeat. Action taken with the drug in response to the events was not applicable. The outcome of the events, no pulse or heartbeat and couldn't wake him up, were not provided. The patient died on 13 Feb 2021. The cause of death was unknown.; Reporter's Comments: Very limited information regarding this event/s has been provided at this time. The patient's medical history of high blood pressure and prostate cancer remains the risk factors. The cause of death was unknown. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for

No prior vaccinations for this event.

vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was	No prior vaccinations for this event.

made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

UNRESPONSIVE TO STIMULI **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

At approximately 930am I arrived at Memory Care. I met with the director of the facility and she directed me to where my team would be setting up. My team consisted of (technician), (nurse) and I. As we were setting up, the director asked how she can help. I explained to her that we would need a designated area for patients to be monitored after vaccination for 15 minutes and maybe even longer . I also explained that we would need one of her staff monitoring while we vaccinate. She agreed, and proceeded to designate her staff and the cafeteria area, facing the vaccination station,the monitoring station. Throughout the day, nurse and I were both vaccinating,while the staff of the facility would monitor the vaccinated patients. I would also stop occasionally to mix the vaccine and check the temperature of the aero safe. At approximately 12:50pm, the director rushed in and stated that a patient is not responding, and that she had been vaccinated. At that point, I grabbed epipens and a thermometer and I also instructed nurse to grab an Epipen and come with me. We followed the director to pt's room. Once we got to the room, the patient was in bed and there were 4 staff members standing bedside and one of them turned and stated the patient has passed. At that point I asked the staff how long ago did the patient get the vaccine, they stated about 30 minutes ago. They also stated that the patient was a hospice patient and that the patient had declined, and was rapidly detiorating and had not eaten or drank anything all day . They also stated that the patient had

No prior vaccinations for this event.

been monitored for 15 minutes post vaccination. I then left the room and grabbed the patients COVID Vaccine intake consent form. I looked at the answered questionaire and all the responses were circled NO. Patient had a temp of 96.5 at the time of vaccination.The vaccine administration information for Immunizer Section was filled out by Nurse. I then proceeded to ask the director once again if there were staff that was monitoring her for 15 minutes, the director stated they had staff monitoring her. She also stated the Hospice nurse has to announce her death, so they waited for the Hospice Nurse to come. I then called Corporate and explained the situation. After speaking to corporate, I also asked nurse, if she remembered the patient. She stated that she did and at the time of the vaccination the patient was not alert, there were two staff members with the patient. She was non oriented and she kept closing her eyes. At that point, Nurse stated that she asked the two staff members with her if this is how she usually is and if its ok to vaccinate her. Both Staff members stated that it its ok,this is how she is. The Nurse then proceeded to vaccinate. At approximately 3:10pm, as I was leaving I spoke to the director, and one of her Staff members. Staff that the patient has actually not eaten/ or drank anything for the past several days, including today(01/18/21). Staff also stated that on Friday, Jan 15th,2021, they had informed the family that the patient was rapidly detiorating. Staff also stated that the family knowingly gave the consent to vaccinate her. She also stated that the hospice Nurse believes that the death was primarily caused by her detiorating state. She also stated that the hospice Nurse informed that the death was not due to the Vaccine. Per Lead Pharmacist at the clinic.

Patient was was brought to the ED from facility which he received the vaccine via ambulance with BiPAP, hypoxia, and one dose of Epi of 0.3 mg. He then required intubation, and had struggled with hypoxia, even on increasing PEEP. CODE BLUE called in the ED for PEA. He was medicated for such (please see the code run sheet for details), and he came in and out of the code 5 times. After 95 minutes, with the wife at the bedside, and family conference by phone, the code was called, and he was pronounced at 18:20. He received in total 8 me of Epi, 3 shots of Atropine, 3 amps bicarb. He got lasix 40 mg, lovenox 60 mg subcutaneous once. He had a CVC into the right internal jugular, and levophed was started, then Epinephrine drip was started. Prior to the code he got steroids (solumedrol 125 mg, then later decadron 6 mg iv), benadryl iv, antibiotics (ceftraixone / zithromax), and lasix 40 mg. All this time while in the ED, the Rt was at the bedside, and lots of secretions from the lungs were aspirated, bloody color. á Code was the result of PEA secondary to hypoxia (	No prior vaccinations for this event.

Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.	No prior vaccinations for this event.

After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with		No prior vaccinations for this event.

minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Narrative: Patient with history advanced vascular dementia, hypertensive cerebrovascular disease and stroke, T2DM. Received her second dose of Pfizer COVID-19 vaccine at approximately 14:00 and was reported to have expired at home at 20:55. Dr. (Medical Director) spoke with patient's son/caregiver 2/4/21. Son reports that patient was in her usual health yesterday morning, deemed well enough by son to travel for vaccination. He reports she had no bothersome symptoms after either first or second vaccinations. Specifically denied rash, wheeze, and difficulty breathing. Son was with patient throughout the day. In the evening, when preparing for bed, he noted she became suddenly unresponsive in a similar fashion as she has done several times in past years. While in all previous such episodes she recovered within minutes, last evening she did not regain consciousness, experiences a brief period of labored breathing, and died. Patient's son called 911 and the patient's body was brought to the medical examiners. The medical examiner declined to proceed with autopsy. Patient's son is not interested in autopsy. Patient's son reports confidence that his mother's underlying hypertensive/diabetic cardiovascular disease is the natural cause of

The next morning, she was found unresponsive and pronounced dead by paramedics.	No prior vaccinations for this event.
UNRESPONSIVE TO STIMULI	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and ACLS guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and ACLS guidelines initiated. á In reviewing patient's chart and nursing home	No prior vaccinations for this event.

notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.

UNRESPONSIVE TO STIMULI	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this	No prior vaccinations for this event.

was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

	UPPER RESPIRATORY TRACT INFECTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."		No prior vaccinations for this event.
	URINARY CASTS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o		No prior vaccinations

some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. COVID19 (COVID19 (MODERNA)) (1201)

Patient had Covid-19 in October of 2020. He recovered. He received the vaccination on 12/30/2020 with no complaints. On 01-05-2021 it was noted to he was incontinent of urine and bilateral lower extremity edema. Lab work was completed showed acute kidney injury. He had decreased blood pressure and oxygen saturations on 01-06-2021 He was admitted to the hospital with rapid progression of symptoms and suggested multi-system failure. He had a long cardiac history. On 01-14-2021 he passed away with a diagnosis of Cardiomyopathic CHF, A.Fib contributory.

No prior vaccinations for this event.

URINARY INCONTINENCE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated at 11:30am. By 7pm he started presenting symptoms of fatigue, chest pain. Patient urinated and defecated in himself. Was not feeling well. Patient died at 10:30pm.

No prior vaccinations for this event.

URINARY LIPIDS PRESENT

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. No prior vaccinations for this event.

middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

URINARY OCCULT BLOOD POSITIVE

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep

No prior vaccinations for this event.

his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

URINARY RETENTION

COVID19 (COVID19

(MODERNA)) (1201)

Death; kidney failure (unable to urinate); shortness of breath; required oxygen; A spontaneous report was received from consumer concerning an 87-year-old, female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced shortness of breath, kidney failure and death. The patient's medical history included advanced kidney and heart disease. No relevant concomitant medications were reported. On 06 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot: unknown) intramuscularly for prophylaxis of COVID-19 infection. On 17 Jan 2021, the husband reported that the patient experienced adverse events. Symptoms included shortness of breath and kidney failure (unable to urinate). The patient was admitted to the hospital and discharged to hospice. Oxygen was administrated for shortness of breath. Action taken with mRNA-1273 in response to the events was not applicable. On 20 Jan 2021, the patient died. The cause of death was unknown. Autopsy details were unknown.; Reporter's Comments: This case concerns a 87-year-old, female patient with the medical history of advanced kidney and heart disease, who experienced fatal unexpected event of dyspnea, renal failure and death. The events of dyspnea and renal failure occurred 12 days and the event of death occurred 15 days after the first dose of mRNA-1273 (Lot: unknown). The patient was admitted to the hospital and discharged to hospice. Oxygen was administrated for shortness of breath. The cause of death was unknown. Autopsy details were unknown. Very limited information regarding this event has been provided at this time. Based on temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. However, the history of advanced kidney and heart disease may remain as confounder. Additional information has been requested.; Reported Cause(s) of Death: Unknown cause of death

URINARY RETENTION

COVID19 (COVID19 (MODERNA)) (1201)

She had pain in the injection site Tuesday night and then during Tuesday she got worse with nausea and some fever. By Wednesday she was complaining that she could not pee even though she was drinking a lot of fluids. She continued to complain it was the worst she ever felt and then at 0600 Thursday morning she

No prior vaccinations for this event.

woke us up and said she needed to go to the hospital. We arrived at the hospital just before 0700 and she immediately threw up in the trash can. We went into a treatment room and they took blood and started fluids as she became incoherent. She said she had taken Tylenol so they started a drug to counter that but her liver function was all wrong and they started to look for a hospital that could transplant a liver. She was air evade about 0930 to Medical center and just over 30 hours latter she was dead. There is a pending autopsy. She was a healthy 39 year old mother who got the shots because she worked as a surgical tech and she was the single mother of a 9 year old little girl.

Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

URINE ANALYSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
1/24/21 0445- patient presents to the ED with complaints of neck pain, chest pain, and back pain for about a week. States also feels SOB, intermittent fever with temperature 100.3 on arrival. Patient was worked up for his cardiac type symptoms, found to have elevated WBC and CRP with no explanation. D-Dimer was elevated with CT showing no sign of PE. Patient was sent home from the ED with instructions to follow up with primary care and/or return if s/s worsen. 1/24/21 1705- patient is returned to the ED via ambulance after becoming unresponsive and some seizure like activity. Patient was intubated. Head CT showed large brain bleed that was irreparable and not compatible with life. Patient was also found with positive blood cultures x2 with gram positive cocci in clusters growing after 9 hours.	No prior vaccinations for this event.

2/2/21-1000-patient presented to the local emergency room with complains of fever, shortness of breath and decreased oxygen sats. temp 101.7, pulse 102, respirations 36, BP 141/92, oxygen 94%. Lung sounds crackles bilaterally with rhonchi on the left. patient worked up for sepsis, CXR shows mild atelectasis. blood pressure dropped, and continued to drop through treatment requiring levophed drop to be initiated. Patient POA determined that this would not be her sister's wishes and made the decision to make patient comfort care status. 2/3/21- patient lethargic throughout night. 0640-patient demise.		No prior vaccinations for this event.
	URINE ANALYSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
Passed away; UTI; Abnormal bleeding; A spontaneous report was received from a healthcare professional concerning a patient who received the Moderna COVID-19 Vaccine (mRNA-1273) and experienced abnormal bleeding, UTI, and passed away. The patient's medical history included a long term history of anticoagulation therapy. Concomitant product use included anticoagulation therapy. On 31Jan2021 prior to the onset of the events the patient recieved their first dose of mRNA-1273 (Lot number:not reported) intramuscularly for prophylaxis of COVID-19 infection. On 07Feb2021, the patient complained of abnormal bleeding. Patient was seen at clinic on 10Feb2021 and was diagnosed with a UTI and given antibiotics. An INR was also completed that day due to patient having a long term history of anticoagulation therapy. Results of that showed the INR to be 12. Prior to vaccination, patient's INR was normal and no changes to		No prior vaccinations for this event.

medications and diet were made after vaccination and prior to complaint starting. On 12Feb2021 the patient passed away. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12Feb2021. The cause of death was unknown. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns an 82 year old male patient, with history of long term anticoagulation therapy (unknown indication), who experienced a fatal event of death and abnormal hemorrhage, 13 days after receiving second dose of mRNA- 1273 (Lot# Unknown). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs	No prior vaccinations for this event.

PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these.

Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they

No prior vaccinations for this event.

started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

URINE LEUKOCYTE ESTERASE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up.

No prior vaccinations for this event.

CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. USE OF ACCESSORY RESPIRATORY MUSCLES

COVID19 (COVID19 (MODERNA)) (1201)

This is a hospice patient under the care of Hospice at an affiliated nursing home. Pt received the vaccination around noon on 2-16-21 by a representative from Pharmacy. The following afternoon 2-17-21 at 14:45 the pt started to experience severe SOB resp rate 36, audible wheezing and use of respiratory accessory muscles. BP180/80, 113 pulse temp 98. Pt was given morphine and ativan. The respiratory distress was eased however pt never returned to baseline and died 2-22-21 around 4am.

No prior vaccinations for this event.

VACCINATION COMPLICATION

COVID19 (COVID19 (MODERNA)) (1201)

On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was

No prior vaccinations for this event.

scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.

VACCINATION COMPLICATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the	No prior vaccinations for this event.

night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

hospital bed. Patient committed suicide in home.

VACCINATION SITE PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient's primary care provider received a death certificate to be signed for this patient. He spoke with the patient's husband and son, who reported that the patient had pain and swelling at the vaccine administration site after receiving the vaccine and was feeling unwell after receiving the vaccine. The patient's family reported that they found her unresponsive on 2/2/21 and called 9-1-1. The patient was pronounced dead upon arrival of emergency responders.	No prior vaccinations for this event.
VACCINATION SITE SWELLING	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient's primary care provider received a death certificate to be signed for this patient. He spoke with the patient's husband and son, who reported that the patient had pain and swelling at the vaccine administration site after receiving the vaccine and was feeling unwell after receiving the vaccine. The patient's family reported that they found her unresponsive on 2/2/21 and called 9-1-1. The patient was pronounced dead upon arrival of emergency responders.	No prior vaccinations for this event.
VAGINAL HAEMORRHAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received dose #1 of COVID-19 vaccine on 1/16/21. Within 3 days, she developed petechiae up to ankles, later rising up to her knees. Pt admitted to hospital on 2/6/21 for symptomatic anemia 2/2 vaginal bleeding. Patient received 4 units FFP, 4 units PRBC, 1 unit cryoprecipitate, and vitamin K 5 mg IV. Also	No prior vaccinations for this event.

started on medroxyprogesterone 20 mg PO TID. Alectinib d/ced due to worsening liver function. Evalauted by OB/GYN and Hematology. Diagnosed with DIC. Patient with worsening bilateral lower extremity edema and purpura with pain and weakness. Palliative care consulted. Patient passed away on 2/11.

VARICES OESOPHAGEAL	COVID19 (COVID19 (MODERNA)) (1201)
Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.	No prior vaccinations for this event.

VASCULAR DEMENTIA	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Narrative: Patient with history advanced vascular dementia, hypertensive cerebrovascular disease and stroke, T2DM. Received her second dose of Pfizer COVID-19 vaccine at approximately 14:00 and was reported to have expired at home at 20:55. Dr. (Medical Director) spoke with patient's son/caregiver 2/4/21. Son reports that patient was in her usual health yesterday morning, deemed well enough by son to travel for vaccination. He reports she had no bothersome symptoms after either first or second vaccinations. Specifically denied rash, wheeze, and difficulty breathing. Son was with patient throughout the day. In the evening, when preparing for bed, he noted she became suddenly unresponsive in a similar fashion as she has done several times in past years. While in all previous such episodes she recovered within minutes, last evening she did not regain consciousness, experiences a brief period of labored breathing, and died. Patient's son called 911 and the patient's body was brought to the medical examiners. The medical examiner declined to proceed with autopsy. Patient's son is not interested in autopsy. Patient's son reports confidence that his mother's underlying hypertensive/diabetic cardiovascular disease is the natural cause of her death. Other Relevant Hx: Symptoms: & Death Treatment:	No prior vaccinations for this event.

VASCULAR DEMENTIA	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"never woke up after arrival; Suffered with vascular dementia; Death cause: Covid/Tested positive to Covid 31Jan, tested due to increased lethargy; This is a spontaneous report from a contactable consumer. An 85-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Jan2021 at single dose for COVID-19 immunization. The patient received the vaccine at nursing home/senior living facility. Medical history included dementia, hypertension, past strokes. The patient was exposed to asymptotic staff member on or prior to 25Jan2021. The patient had no known allergy. No COVID prior vaccination. Concomitant medication included lisinopril. No other vaccine was received in four weeks. The patient was tested positive to COVID on 31Jan2021, tested due to increased lethargy started from 26Jan2021. The patient suffered with vascular dementia. She was ambulatory up to 31Jan2021. The patient was sent to hospice that evening on 31Jan2021 to quarantine, never woke up after arrival. Palliative Care started 02Feb2021, the patient expired 12Feb2021. Cause of death was COVID. The patient did not receive treatment for events. The autopsy was not performed. The outcome of events ""never woke up, vascular dementia"" was unknown. Information on Lot /Batch Number has been requested.; Reported Cause(s) of Death: Death cause: Covid"	No prior vaccinations for this event.

VASOGENIC CEREBRAL OEDEMA	COVID19 (COVID19 (MODERNA)) (1201)
From CT Scan in ED at 7:40 pm on 1/25/2021 -- There is a large intraparenchymal hemorrhage with Surrounding vasogenic edema within the left occipital lobe. There is additional subdural hemorrhage layering along the left frontal, temporal and parietal convexity which may be decompressing from the area of intraparenchymal hematoma. No visualized intraventricular hemorrhage.There is some trace hemorrhage layering along the left tentorium cerebelli. Severe associated mass effect with left-to-right midline shift of 2.1 cm. There is subfalcine and downward transtentorial herniation with complete effacement of the basilar	No prior vaccinations for this event.

cisterns. Evaluation of the craniocervical junction is limited due to beam hardening artifact. Near-complete effacement of the left lateral ventricle. No head trauma or fall. Deceased 1/26/2021

VASOPRESSIVE THERAPY		**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.		No prior vaccinations for this event.
VASOPRESSIVE THERAPY		**COVID19 (COVID19 (MODERNA)) (1201)**
pt received vaccine on 2/3. early on 2/4 developed chest pain, dyspnea, and was seen in ED and diagnosed with acute exacerbation of CHF and NSTEMI type 2, and anemia. on 2/5 transfusion was started and pt developed worsening dyspnea and then PEA arrest. Pt achieved ROSC and was transferred to the cardiac intensive care unit where he required vasopressor support. he subsequently declined and died on 2/7		No prior vaccinations for this event.
VEIN DISORDER		**COVID19 (COVID19 (PFIZER-BIONTECH))**

	(1200)
L hand edema, hematoma which burst and caused bleeding sending pt to the ER for pressure dressing and 2 stitches. L hand and arm progressively got more edematous and bruised looking (severely black/blue/purple) and the hand continued to bleed and swell on 2/6/21. Severe arterial and venous issues and apparent blood clots. On 2/7/21 there were also lumps noted on left inner thigh. Pt. stopped eating or drinking on 2/8/21 and expired on 2/12/21.	No prior vaccinations for this event.
VENTRICULAR DRAINAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no	No prior vaccinations for this event.

spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

VENTRICULAR DRAINAGE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.	No prior vaccinations for this event.

VENTRICULAR DRAINAGE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
[COVID-19 mRNA vaccine (Pfizer-BioNtech] treatment under Emergency Use Authorization (EUA)	No prior vaccinations for this event.
VENTRICULAR FIBRILLATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Almost immediate headache per wife. Developed fever around 4 pm. Headache all day. Took Tylenol at 4 and 10 pm. Gradual development of SOB and cough. Temp of 101.4 at 10 pm. pulse ox 92% at 10 pm. Went to sleep, woke up at 0050 with increasing SOB. Pulse ox 82%. Used albuterol inhaler, wife called emergency services at 0113. EMS arrived around 0130 to patient's home. pulse ox 86%, coughing, sob, hard time breathing. Walked to stretcher. Became unresponsive. Found to have no pulse, stopped breathing. CPR initiated at about 0140. King airway placed in field, I/O in left tibia. Patient from PEA to asystole, to vfib, to asystole. ACLS followed. Unrecoverable asystole and patient time of death 0213.	No prior vaccinations for this event.
VENTRICULAR FIBRILLATION	**COVID19 (COVID19 (MODERNA)) (1201)**
Received first 1/15/2021 with no adverse reaction. Received 2nd dose 2/9 @ 0846 with no adverse reaction or report of feeling ill. Traveled to store and arrived approx. 2 hours after receiving vaccine. Daughter stated patient felt well and had to go to the restroom to have BM. Collapsed in bathroom. Transported by ambulance to Hospital @ 1439 in cardiac arrest. Was in PEA and went in v fib back to PEA. Resuscitation efforts initiated and patient expired with time noted at hospital records at 15:11.	No prior vaccinations for this event.
VENTRICULAR FIBRILLATION	**COVID19 (COVID19**

VENTRICULAR FIBRILLATION **COVID19 (COVID19 (MODERNA)) (1201)**

Patient was at a gym watching his daughter. He slumped over unconscious. EMS was called. He was found to be in fine ventricular fibrillation and resuscitation efforts failed. He was brought to Hospital ED where he was pronounced dead. He had underlying cardiac disease but his family requested I report this event as possibly related to the recent COVID vaccination.	No prior vaccinations for this event.

VENTRICULAR FIBRILLATION **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.	No prior vaccinations for this event.

VENTRICULAR FIBRILLATION **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins.	No prior vaccinations for this event.

Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.

	VENTRICULAR FIBRILLATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"CC:full arrest HPI:HPI and ROS limited due to patient's condition. History is via EMS, medical record, and son. Per Son patient had Covid vaccine on Saturday morning. Slept all day Sunday. Woke up Sunday night a bit ""like coming out of a deep sleep per son, around 10 pm. Shortly after that patient was having a hard time breathing. Emergency called. Arrested around the time EMS arrived. King airway, I/O and CPR initiated. Patient has been in v fib. Was shocked multiple times, given 4 rounds of epi, bicarb and amiodarone. ACLS continued on arrival. Multiple rounds of epi, and attempted defib. Patient given epi, bicarb. Rhythms included fine v fib, asystole, and PEA. Unrecoverable with no cardiac motion. Time of death 11:50 pm."		No prior vaccinations for this event.

	VENTRICULAR FIBRILLATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific		No prior vaccinations for this event.

conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.

VENTRICULAR FIBRILLATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient arrived at ER with complaints of CPR in progress. Per EMS, patient became short of breath while performing yard work on 1/26/2021. At arrival, patient was in fine v fib with a total of 6 shocks delivered along with 300 mg amiodarone followed by 150 mg amiodarone, 1 amp epinephrine and 2 epinephrine drips adminstered en route to ED. CPR initiated at 1755 and EMS reports asystole at 1829. TOD 1909 pronounced by ED DO Dx: Cardiac arrest	No prior vaccinations for this event.
VENTRICULAR FIBRILLATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Per EMS, the patient was last seen walking and talking to wife 10 minutes prior to EMS arrival. EMS reports via patients wife, that patient was upstairs to change for his doctor appointment then patient's wife found him down. The patient received his COVID-19 vaccine on 1/25/21. EMS states they gave 5 rounds of EPI then patient moved into vfib then was shocked once but returned to asystole. In ED, the patient initially in asystole CPR was started immediately. The patient was given 3 rounds EPI, 1 round bicarb. The patient stayed in PEA throughout. Patient was given tPA. Patient continued to be in asystole and time of death was called at 11:35 am.	No prior vaccinations for this event.

		(1200)
73-year-old man s/p first dose of Pfizer at 10:20 AM Ambulated comfortably to exit after 20 minutes in observation but 10:45 collapsed while exiting the building 10:47 CPR initiated 10:49 medical team/EMS found no pulse, agonal respirations, ventricular fibrillation Paramedics and team performed ACLS; of note patient was intubated 7.5 ETT with bilateral breath sounds on ventilation; paramedic reported easy intubation with no apparent throat swelling; 11:02 transported to Emergency Department 11:30 Pronounced dead at Emergency Department	No prior vaccinations for this event.	
VENTRICULAR FIBRILLATION		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On 2/5/2021 resident noted to be azotemic. Creatinine up to 3.8 and BUN in 80's. He was started on NS hydration. On 2/7/2021 he was noted without VS, per MD notes, possible VF arrest, renal failure; death unclear exact cause.	No prior vaccinations for this event.	
VENTRICULAR FIBRILLATION		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was coded and expired Code Blue: Patient was in dialysis, after 30 minutes his sbp dropped to 60s he was given 4 albumin. Patient who was responsive before that became unresponsive, had seizure like activity, lost pulse and spontaneous breathing. HD stopped. Code called. Cpr started. A few minutes into cpr patient started to profusely bleed - gi bleed and ventilation became very hard., intubation was very difficult and ventilation hard as we suctioned large amounts of aspirated blood. Patient was eventually intubated. More than 8 doses of epi ws given, sodium bicarbonate * 2 given with continuous cpr. It was mostly PEA with one shockable rhythym. And shock delivered for vfib. patient continued to profusely bleed, og insertion was not successful and effective ventilation was very tough due to massive aspiration,.	No prior vaccinations for this event.	

Possible variceal rupture with cpr from his cirrhosis is likely scenario. After 30 minutes of unsuccessful ventilation and acls protocol. Code was stopped.

	VENTRICULAR FIBRILLATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received the vaccine at an outside healthcare facility on 2/11/21. At approximately 1 pm she screamed out and fell out of her chair. EMS was called and patient was found to be in Vfib. ACLS was performed for approximately 42 minutes prior to arrival at ED. At that time the patient had been pulseless for 25 minutes. Patient received 450 mg of amiodarone, epinephrine x7, sodium bicarbonate x2, and 7 AED shocks. In the ED 3 more doses of epinephrine were given, one more dose of sodium bicarbonate, and 5 additional shocks. ROSC was not achieved and time of death was called at 1416.		No prior vaccinations for this event.

	VENTRICULAR FIBRILLATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Few minutes post vaccination, after moving to observation area via wheelchair, the patient complained of dizziness. She took glucose tabs she had brought with her. Staff wheeled her to Triage # 1. Her eyes rolled back in her head and she lost consciousness. Staff (paramedics on site) transferred her to gurney and started compressions. AED placed, V- Fib was rhythm, Shock # 1 given, CPR resumed. Shocked again. Fire truck and additional EMT arrived on site and took over care. Epinephrine was given 3 times via intra-osseous route, Amiodarone given intra-osseous route. Additional defibrillation with on site AED for a total of 6-7 times. Patient had good chest rise with ambu-bag, no airway obstruction or peri-oral edema noted. Code called at 12:40 PM.		No prior vaccinations for this event.

VIRAL TEST

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient 101 years old, nursing home resident, received vaccine 1/11, on 1/13 found on floor without obvious trauma, unresponsive. Brought to ED and was bradycardic, hypotensive, hypothermic and refractory to aggressive medical management. No obvious cause of death found on exam or labs, cxr. Unknown if event could be related to vaccine or not. Medical Examiner accepted case although initially unknown that patient had recently received vaccine. ME updated with that information today as soon as discovered.

No prior vaccinations for this event.

VIRAL TEST NEGATIVE

COVID19 (COVID19 (MODERNA)) (1201)

Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient

No prior vaccinations for

who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia	this event.

Headache, pain in the injection site, threw up. A few hours later she died. No prior vaccinations for this event.

VOMITING	**COVID19 (COVID19 (MODERNA)) (1201)**	
My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.		No prior vaccinations for this event.
VOMITING		**COVID19 (COVID19 (MODERNA)) (1201)**
"Pt. woke up the next morning after vaccination and ""didn't feel well"", described by wife as fatigue, no energy. At approximately 2 PM, he vomited. His wife checked on him at 4:20 PM and he wasn't breathing sitting in his chair. EMS squad was called but when they arrived he was asystole and mottling present. Did not start CPR since he was already gone too long. Pronounced by coroner on scene."		No prior vaccinations for this event.

he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body

VOMITING

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar

No prior vaccinations for this event.

opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

VOMITING		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On December 17, 2020, my husband, received his first BioNTech BNT162b2 COVID-19 vaccination. On Thursday January 7, 2021, he received this second COVID-19 vaccination. The following three days after his second vaccination, he felt fine. The fourth day, on Sunday January 10, my husband felt extremely fatigued. On Monday the 11th and Tuesday the 12th, he worked a full shift but complained of extreme fatigue and extreme chills to the point that his teeth were chattering while on the phone with me. He decided to work through it. When he got home on Monday night, he started vomiting. On Wednesday January 13, he woke up and had swollen eyes. Once again, he felt extremely fatigued, even after a full nights rest. He had the day off but had an early meeting. After his meeting, he was still tired so he went back to sleep. I left to get lunch, and drop off our kids, and upon my return, I found him on the walk in closet floor, face up, having passed away. He felt as cold as ice. The rapid test done after they called the paramedics resulted in a negative COVID-19 test for him.	No prior vaccinations for this event.	
VOMITING		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

VOMITING	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had	No prior vaccinations for this event.

trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare

Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

WEIGHT DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.

No prior vaccinations for this event.

WEIGHT DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"The day after the 2nd shot, patient developed blisters on his lips and mouth. The care facility said that he had a nut allergy -- but he had never been allergic to nuts. He stopped eating and drinking and his BP had dropped to 60/40. By Jan 16th they called to say he was dying and he passed away on 1/18/21. Patient had COVID19 from Oct 29th - early November. By Nov 21st he had lost 40 lbs. He was 6'3"" and had gone from 189lbs to 149 lbs with COVID. By Nov 21st when we could visit, he had recovered from COVID, but was very thin and weak. He could not bathroom alone and kept falling. He didn't seem to have a bad reaction to the 1st COVID shot, But he immediately reacted to the 2nd shot

Shingles - Glaxo 8/22/2020, resulted in hospitalization and LTC.

and passed away within 6 days."

	WEIGHT DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/7/21 Increased difficulty chewing, swallowing, evaluated by SLP and dietician. Diet texture down-graded x 2 with poor appetite and recent 6lb weight loss. 2/8/21-APRN updated regarding poor appetite and difficulty chewing as well as downgraded texture of diet. Also informed of increased s/s of discomfort and increased use of PRN Oxycodone for pain. 2/9/21- elevated temp 100.7. 2/9/21 Covid pcr test negative. 2/9/21-N.O.?s APRN BMP, Albumin and Pre-albumin Level in am. 2/11/21-elevated temp 100.4. Covid rapid test negative. 2/12/21- CBG recorded at 517 at 5:20 am. Resident also has an elevated temp of 100.9. Tylenol administered per order. Vital signs include resp 24, radial pulse 134, O2 sat 83%. Supplemental oxygen administered via nasal cannula. Head of bed elevated. DR. notified at time via telephone. Order given for sliding scale for CBG. Guardian updated regarding changes in residents condition, poor prognosis. Guardian requests Hospice eval and admit. Guardian requests comfort care no hospitalization, no IV's, no G-tubes, no labs etc, D/C of Palliative services. ARNP informed. 2/12/21 Acute Telehealth visit with APRN due to increased lethargy, elevated CBG?s despite poor appetite and insulin administration. Resident unresponsive to verbal and noxious stimuli at time of visit. N.O. Morphine sulfate 20mg/ml, give 2.5mg PO/SL Q4hr PRN pain/shortness of breath. 2/12/2021-Admitted to Hospice, Lethargic, diaphoretic, T 98.1 P 130's R 18 O2 high 80's to low 90's via O2 mask at 3L. 2/12/2021- Resident legs and arms noted to feel cool this afternoon, 02 sat was 97% with 02 on @ 3L with mask Noted resident with sob and increased pulse. Prn morphine 0.25ml sl. given with good effect. Resident was less restless and quiet in her bed. Checked on resident several times this shift for needs. WHITE BLOOD CELL COUNT DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the

No prior vaccinations for this event.

evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or

No prior vaccinations

injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

COVID19 (COVID19 (MODERNA)) (1201)

Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse

continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th

time at 08:18. Family at beside, Mother asks for code to be stopped."

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative.

No prior vaccinations for this event.

Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.

No prior vaccinations for

to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

WHITE BLOOD CELL COUNT NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."		No prior vaccinations for this event.

WHITE BLOOD CELL COUNT NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Symptoms of fever (Tmax 102.9), diarrhea, and altered mental status started ~ 24 hours after vaccination. No evidence of septicemia with negative blood cultures Minimal improvement over 3 days, transferred to tertiary care center for MRI brain after which LP was recommended. However family declined as intubation would have been required and was not consistent with patient's goals of care.	No prior vaccinations for this event.	
WHITE BLOOD CELL COUNT NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.

WHITE BLOOD CELL COUNT NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without	No prior vaccinations for this event.

a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. "In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."	No prior vaccinations for this event.
WHITE BLOOD CELLS URINE POSITIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature	No prior vaccinations for this event.

management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5.

Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

WITHDRAWAL OF LIFE SUPPORT	**COVID19 (COVID19 (MODERNA)) (1201)**
We don't know what happened. 25 hours after the shot, he started gagging and stopped breathing. He was pronounced at OSF at 8:07pm after we took him off life support.	No prior vaccinations for this event.
WITHDRAWAL OF LIFE SUPPORT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
The patient had an apparent cardiac arrest on 12/23/20 and was admitted to the ICU. He was taken off of life support on 12/30/20. He had known cardiac disease.	No prior vaccinations for this event.
WITHDRAWAL OF LIFE SUPPORT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Staff member checked on her at 3am and patient stated that she felt like she couldn't breathe. 911 was called and taken to the hospital. While in the ambulance, patient coded. Patient was given CPR and ""brought back"". Once at the hospital, patient was placed on a ventilator and efforts were made to contact the guardian for end of life decisions. Two EEGs were given to determine that patient had no brain activity. Guardian, made the decision to end all life saving measures. Patient was taken off the ventilator on 1/9/2021 and passed away at 1:30am on 1/10/2021. The initial indication from the ICU doctor was the patient had a mucus plug that she couldn't clear."	No prior vaccinations for this event.
WOUND	**COVID19 (COVID19 (PFIZER-BIONTECH))**

	(1200)
Patient tested positive for COVID-19 on 1/8/21. She demonstrated a decline in appetite and the ability to feed herself d/t this illness, but no respiratory or other symptoms. She received COVID-19 vaccine #2 on 1/26/21. She demonstrated an SDTI wound to the Lt. heel on 1/27/21. On 1/31/21 she was noted to have a significant weight loss. She was admitted to services on 2/1/21 with comfort care orders. On 2/2/21 she was observed to be without vital signs. Orders were for DNR, and CPR was not initiated in accordance with that order. She was pronounced dead at 0112 on 2/1/21.	No prior vaccinations for this event.
WOUND CLOSURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
All residents had been in isolation due to multiple cases of COVID in the facility. Resident voiced no health related complaints. He continued to visit with staff and required moderate assist with toileting. Resident had fall 0130 on 1-15-2021, which resulted in laceration with surgical repair. Resident was noted to change in mental status and respirations on morning of 1-16-2021 during morning blood sugar check. Resident had O2 @1.5l/m via n/c and respirations of 10 with periods of apnea and unresponsive to verbal stimuli. Blood sugar was 583. Resident deceased upon re-check after calling PCP to report status change.	No prior vaccinations for this event.
WOUND SECRETION	**COVID19 (COVID19 (MODERNA)) (1201)**
I video chatted with her Thursday after receiving the vaccine. My mom was in poor health but she was talking in complete sentences and responded appropriately. She was upright in bed and made eye contact. She smiled and denied pain. By Sunday, she was extremely weak and unable to sip water with a straw. Her health had changed dramatically and rapidly. She moaned in pain and was very fatigued. Her condition continued to deteriorate over the week and she stopped talking and was constantly sleeping. They started antibiotics for the oozing cancer lesion and then morphine for pain and end of life care. She passed away on January 22nd	No prior vaccinations for this event.

which was 15 days post vaccination.

	X-RAY ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
At approximately, 1855, I was alerted by caregiver, resident was not responding. Per caregiver, she was doing her rounds and found resident in bed, unresponsive, mouth open, observed gurgling noises and tongue hanging out of mouth. This primary caregiver observed resident at baseline and ambulating after dinner at approximately, 1800 less than an hour prior to incident. This PCG called 911 for EMS and gave report of incident. Resident was taken to Medical Center Emergency Department. At ER, CT scan and X-ray was performed. Per report from ER RN, CT scan and x-ray revealed an intracranial aneurysm and fluid in the lungs. Per RN, resident was still unresponsive and was admitted to Medical Center for observation and comfort measures. This primary caregiver reported to RN, resident recently received the first dose of COVID-19 vaccine on 1/2/21. Primary caregiver received a call from Castle RN at 0700, resident expired at 0615.		No prior vaccinations for this event.

	X-RAY ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Per family, patient has been feeling sick since he was vaccinated, patient went to ER on 02/15/2021, and after few hours at ER patient passed away.		No prior vaccinations for this event.

	X-RAY NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident yelling for assistance in apartment. Nursing personnel found resident on floor at 6:10 AM on 2/18/2021. Resident was transported to Hospital on 2/18/2021. Status update on 2/18/2021 from son, resident CT & X-rays were done all normal. Labs done and WBC count was elevated and awaiting results. Resident stable and admitted to hospital for observation. Resident passed away on 2.21.2021.		No prior vaccinations for this event.

X-RAY OF PELVIS AND HIP	**COVID19 (COVID19 (MODERNA)) (1201)**
VACCINATION WAS RECEVIED THE MORNING OF 1/5/2021- IN THE EVENING OF THAT DAY RESIDENT SUSTAINED A FALL AND WAS TRASNPORTED TO FACILITY FOR TREATMENT. IT IS NOT UNUSUAL THAT RESIDENT WAS SELF TRANSFERRING AND HAS A HISTORY OF FALLS.	No prior vaccinations for this event.
X-RAY OF PELVIS AND HIP NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient recieved vaccine 1 of covid 19 i 1/19/2021. She felt poorly on 1/20/2021. She felt dizzy and fell at 3 AM on 1/23/2021. She felt poorly and did not know her son's name which was not normal. She went to ER on 1/24. She was assessed as not having fractures. She was going to be transferred to a skilled nursing facility. She was not having respiratory complaints. She was awaiting transfer when her O2 levels started dropping substantially. She declined aggressive intervention and she died within a few hours.	No prior vaccinations for this event.
X-RAY WITH CONTRAST	**COVID19 (COVID19 (MODERNA)) (1201)**
Death	No prior vaccinations for this event.

Note: Submitting a report to VAERS does not mean that healthcare personnel or the vaccine caused or contributed to the adverse event (possible side effect).

TopOptionsNotesCitationQuery Criteria

Notes:

VAERS accepts reports of adverse events and reactions that occur following vaccination. Healthcare providers, vaccine manufacturers, and the public can submit reports to VAERS. While very important in monitoring vaccine safety, VAERS reports alone cannot be used to determine if a vaccine caused or contributed to an adverse event or illness. The reports may contain information that is incomplete, inaccurate, coincidental, or unverifiable. Most reports to VAERS are voluntary, which means they are subject to biases. This creates specific limitations on how the data can be used scientifically. Data from VAERS reports should always be interpreted with these limitations in mind.

The strengths of VAERS are that it is national in scope and can quickly provide an early warning of a safety problem with a vaccine. As part of CDC and FDA's multi-system approach to post-licensure vaccine safety monitoring, VAERS is designed to rapidly detect unusual or unexpected patterns of adverse events, also known as "safety signals." If a safety signal is found in VAERS, further studies can be done in safety systems such as the CDC's Vaccine Safety Datalink (VSD) or the Clinical Immunization Safety Assessment (CISA) project. These systems do not have the same limitations as VAERS, and can better assess health risks and possible connections between adverse events and a vaccine.

Caveats:

Key considerations and limitations of VAERS data:

- Vaccine providers are encouraged to report any clinically significant health problem following vaccination to VAERS, whether or not they believe the vaccine was the cause.
- Reports may include incomplete, inaccurate, coincidental and unverified information.
- The number of reports alone cannot be interpreted or used to reach conclusions about the existence, severity, frequency, or rates of problems associated with vaccines.
- VAERS data are limited to vaccine adverse event reports received between 1990 and the most recent date for which data are available.
- VAERS data do not represent all known safety information for a vaccine and should be interpreted in the context of other scientific information.

Some items may have more than 1 occurrence in any single event report, such as Symptoms, Vaccine Products, Manufacturers, and Event Categories. If data are grouped by any of these items, then the number in the Events Reported column may exceed the total number of unique events. If percentages are shown, then the associated percentage of total unique event reports will exceed 100% in such cases. For example, the number of Symptoms mentioned is likely to exceed the number of events reported, because many reports include more than 1 Symptom. When more then 1

Symptom occurs in a single report, then the percentage of Symptoms to unique events is more than 100%. More information.

Data contains VAERS reports processed as of 3/5/2021. The VAERS data in WONDER are updated weekly, yet the VAERS system receives continuous updates including revisions and new reports for preceding time periods. More information.

Help: See The Vaccine Adverse Event Reporting System (VAERS) Documentation for more information.
