ABDOMINAL DISCOMFORT	**COVID19 (COVID19 (MODERNA)) (1201)**			

Stomach upset, sudden heart failure, death No prior vaccinations for this event.

ABDOMINAL DISCOMFORT **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble

No prior vaccinations for this event.

with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their

car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

ABDOMINAL DISCOMFORT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
cardiac arrest due to pericardial effusion; cardiac arrest due to pericardial effusion; On 21Feb he went to the ER after vomiting and passing out; On 21Feb he went to the ER after vomiting and passing out; On 19Feb, he began to feel ill again with a fever. He felt worse on 20Feb; On 19Feb, he began to feel ill again with a fever. He felt worse on 20Feb; fever; headache; stomach upset; This is a spontaneous report from a contactable consumer reporting for the father: A 75-year-old male patient received the 1st dose of bnt162b2 (BNT162B2, Lot # EL3428) at single dose at left arm on 03Feb2021 for Covid-19 immunisation. Medical history included type 2 diabetes mellitus. No known allergies. The patient had not experienced Covid-19 prior vaccination. Concomitant medication in 2 weeks included amitriptyline hydrochloride (manufacturer unknown) 10 mg, atorvastatin (manufacturer unknown) 20 mg, dutasteride (manufacturer unknown) 0.5 mg, linaclotide (LINZESS) 290 mcg, gabapentin (manufacturer unknown) 300 mg, montelukast (manufacturer unknown) 10 mg, ramipril (manufacturer unknown) 5 mg, insulin degludec (TRESIBA) 100 unit/ml, liraglutide (VICTOZA) 18 mg/3ml solution. No other vaccine in 4 weeks. The patient experienced cardiac arrest due to pericardial effusion on 21Feb2021 14:15, fever on 13Feb2021, headache on 13Feb2021, stomach upset on 13Feb2021, on 19feb, he began to feel ill again with a fever, he felt worse on 20feb on 19Feb2021, on 21feb he went to	No prior vaccinations for this event.

the ER after vomiting and passing out on 21Feb2021. Events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of cardiac arrest due to pericardial effusion. Course of events: In Feb2021, 10 days after his 1st injection, the patient developed fever, headache, and stomach upset. He went for a rapid Covid-19 test (nasal swab) and it was negative on 11Feb2021. The doctor told him he might be having a delayed reaction to the vaccination. After a couple of days, he improved. On 19Feb2021, he began to feel ill again with a fever. He felt worse on 20Feb2021. On 21Feb2021 he went to the ER after vomiting and passing out and received treatment: IV fluids, diagnostic testing at ER. Rapid Covid test (nasal swab) at ER came back negative again on 21Feb2021. His heart arrested suddenly and he could not be resuscitated. CT scan results, that came back after death, showed Covid like pneumonia and pericardial effusion. The patient died on 21Feb2021 14:15. Cause of death was cardiac arrest due to pericardial effusion. An autopsy was not performed. The outcome of cardiac arrest due to pericardial effusion was fatal, of fever, headache, stomach upset was recovering, of he began to feel ill again with a fever, he felt worse was not recovered, of he went to the ER after vomiting and passing out was unknown.; Reported Cause(s) of Death: cardiac arrest due to pericardial effusion; cardiac arrest due to pericardial effusion

ABDOMINAL DISTENSION

COVID19 (COVID19 (MODERNA)) (1201)

"02/08/21--2 days after vaccine--Resident stated that she ""didn't feel good"" (She is developmentally delayed and less able to communicate how she feels than those in the community) and stopped eating most foods; also had fatigue. Vitals, coloring, & behavior were normal. 02/09/21--Belly was firm and mildly distended (although she stated it didn't hurt); she coded this evening and CPR was performed before EMT could transport her to the hospital. 02/10/21--Resident passed."

No prior vaccinations for this event.

ABDOMINAL DISTENSION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."	No prior vaccinations for this event.
ABDOMINAL INJURY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Fall 2/4 hospital admission 2/7/21 with death on 2/8/2021. Patient continued to decline on Bipap he was a DNR/DNI and family decided on comfort measures and he expired 2/8/2021.	No prior vaccinations for this event.
ABDOMINAL PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**

Abdominal pain, Headaches, chest pain, loss of appetite, confusion, elevated liver enzymes 1/8-1/15/21	No prior vaccinations for this event.
ABDOMINAL PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt. presented to the ER with abd pain and septic shock. Pt. reported to feel ill shortly after receiving the vaccine.	No prior vaccinations for this event.
ABDOMINAL PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
On 2/1/2021, the patients daughter, who claims is a nurse, reported this incident to me. She stated that the evening after the patient received the vaccine, she felt some mild injection site pain. The morning after, the patient reported severe abdominal pain, diarrhea and vomiting. The patients daughter then called her physician to report these symptoms and attributed them as an adverse reaction to the vaccine at that time. These symptoms were intermittent for one week and no other adverse reactions were noted. In the early morning hours of 1/27/2021, the patient was toileting and had expired while doing so. An ambulance was called and cause of death was not found. An autopsy was not performed.	No prior vaccinations for this event.
ABDOMINAL PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
Toileting and had expired while doing so; Severe abdominal pain; Diarrhea; Vomiting; Mild injection site pain; A spontaneous report was received from a healthcare professional concerning an 88-year-old , female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events, toileting and had expired while doing so (death), mild injection site pain, severe abdominal pain, diarrhea, and vomiting. The patient's medical history was not provided. No relevant concomitant medications were reported. On 20 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 029L20A)	No prior vaccinations for this event.

intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 20 Jan 2021, the patient felt mild pain at the injection site after receiving the vaccine. On 21 Jan 2021, the patient reported severe abdominal pain, diarrhea and vomiting. These symptoms were intermittent for a week and no other adverse events were noted. On 27 Jan 2021, the patient passed away while toileting. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 27 Jan 2021. The cause of death was unknown. An autopsy was not performed.; Reporter's Comments: The gastrointestinal events were consistent with increased risk associate with elderly age of patient. The cause of death was unknown. Autopsy was not performed. Very limited information regarding the events is available at this time. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Reported Cause(s) of Death: unknown cause of death

ABDOMINAL PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.	No prior vaccinations for this event.
ABDOMINAL PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
911 called to patients house for trouble breathing and abdominal pain. Patient coded, wife presented DNR paperwork. Patient presented to Hospital DOA at 0958.	No prior vaccinations for this event.
ABDOMINAL PAIN	**COVID19 (COVID19 (MODERNA)) (1201)**
Mentation has declined since hospital discharger for fall on 2/6/20201. Patient has also had significant poor oral intake. Brought in due to apneic episodes. Abdominal pain - diffuse tenderness (right sided) Elevated	No prior vaccinations for

liver enzymes - likely secondary to dehydration Increased serum creatine kinase - likely due to dehydration		this event.
	ABDOMINAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
54 y/o M with PMH of HTN, HLD, Alcoholic Cirrhosis, Aortic Valve Stenosis, and angina BIBA as a Medical Alert for cardiac arrest noted PTA. Per EMS, the patient called because he was having constant, diffuse abdominal pain x 1 day that radiated to his chest. On scene, the patient had a witnessed arrest with EMS starting CPR. He was given 3 rounds of epi without ROSC. Pt had no associated shockable rhythm. Of note, pt's wife, had noted pt had received covid vaccine the prior day.		No prior vaccinations for this event.
	ABDOMINAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
presented to ED 1/9/21 with abdominal pain, progressive worsening weakness and fatigue and new onset A fib with RVR likely due to hypertensive urgency . Patient progressed clinically with severe hypoxia and transferred to ICU and started on BiPAP; progressive decline with decreased urinary output with uremia likely secondary to sepsis. Concern with patient worsening clinical decline, palliative care had been consulted on end of life care. Patient expired 1/17/21		No prior vaccinations for this event.
	ABDOMINAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient stated he wasn't feeling well on January 25, 2021, wasn't eating and complained of abdominal pain. Patient noted to have indigestion and was constipated. Meds provided and labs ordered. On morning of January 26, 2021, patient became weak, lethargic and hypoxic and was sent to emergency department		No prior vaccinations for this event.

around 0700 hours on January 26, 2021. At approximately 1100 hours, emergency physician notified this writer that patient was not going to overcome his illness and would be placed on comfort care. At approximately 1130 hours, this writer was notified that patient had passed away from multi-organ failure.		
	ABDOMINAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient with inoperable pancreatic cancer received second Pfizer vaccine approximately 12:30 pm on 1/27/21. At approximataely 16:30, patient complained of abdominal pain and was given Levsin 0.125mg and morphine 5mg orally. At approximately 19:30 patient was found on the floor covered in a large amount of emesis, unresponsive without a pulse.		No prior vaccinations for this event.
	ABDOMINAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Day after receiving the vaccine, the patient complained of abdominal pain which worsened over the day. She went to the ED and was hospitalized. Abdominal pain complaints increased and continued, she decompensated rapidly, was intubated and subsequently died 3 days later. Imaging results showed, progressive ovarian cancer in the bowels. Blood culture revealed that she had E.Coli in her blood. It is thought that this is NOT related to the vaccine.		No prior vaccinations for this event.
	ABDOMINAL PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was tested for covid on 2/2/21 with positive resulted. Presented to Hospital ER on 2/10/21 with c/o of abdominal pain. Diagnosed with gastritis, prescribed metoclopromide and famotidine and dc home. Returned		No prior vaccinations

to ER on 2/13/21 with c/o of weakness, diarrhea, foot ulcer, and loss of appetite. Diagnosed: 1) Dyspnea and hypoxia secondary to Covid-19 2) Extensive bilateral lung infiltrates secondary to Covid-19 3) Increased Cr 4) Increased LFTs, ferritin, d-dimer, troponin secondary to Covid-19 5) Elevated procalcitonin placing the patient at high risk for sepsis 6) Chronic appearing Right foot wound without signs of secondary infection Patient transferred to a different hospital in another city.	for this event.
ABDOMINAL PAIN LOWER	**COVID19 (COVID19 (MODERNA)) (1201)**
Cardiac arrest; Pain on her upper right chest; Lot of pain in lower abdomen; Pain underneath arm; Thought it was muscle aches; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed upper right chest pain and underneath the arm, severe abdominal pain, muscle aches and cardiac arrest. The patient's medical history was not provided Concomitant product use was not provided by the reporter. On 14 Jan 2021, approximately five days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the arm for prophylaxis of COVID-19 infection. On 19 Jan 2021, the patient developed upper right chest pain and pain underneath the arm. They thought it was muscle aches. Sometime later, the patient developed a lot of pain in the lower abdomen. The called emergency services and an ambulance arrived but the patient then suffered cardiac arrest. Treatment for the event included tramadol. Action taken with mRNA-1273 in response to the events was not applicable due to the patient was died. The patient died on 19 Jan 2021. The cause of death was reported as cardiac arrest. Autopsy were not provided.; Reporter's Comments: Company Comment: This case concerns a 92-year-old female patient who experienced unexpected serious events of cardiac arrest, upper right chest pain and underneath the arm, severe abdominal pain, muscle aches. The event occurred 5 days after the administration of the first dose of the vaccine mRNA-1273 vaccine (Lot #: unknown, expiration date-unknown). Although a temporal association exist between the events and the administration of the vaccine, in the absence of critical details such as the patient's medical history, any diagnostic test or autopsy result, adequate evaluation and assessment cannot be established. Main field defaults to æpossibly related' for all events.; Reported Cause(s) of Death: Cardiac	No prior vaccinations for this event.

arrest

	ABDOMINAL PAIN UPPER	**COVID19 (COVID19 (MODERNA)) (1201)**
Feb 8 states she had a cold. Feb 9 added stomach ache and nausea. Feb 9 visited urgent care facility for exam and Covid-19 test. Rapid test results were negative. Appeared tired but fine. Told to go home and rest. Feb 10 at 9:00 am found dead on the floor in pool of blood and aspirated. Excessive blood in toilet, pooled on floor and hallway rug.		No prior vaccinations for this event.
	ABDOMINAL PAIN UPPER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Daughter call in for VAERS report to file for father whom committed suicide 1/16/2021 in the AM after reportable ae of COVID 19 vaccine administered 1/14/2021. Patient sought care twice at ER; first visit by ambulance around 5PM and Friday 1/15/2021 Medical Center: Emergency Room. 1st Discharge summary diagnosis: adverse reaction to COVID shot; 2nd Discharge summary diagnosis: adverse reaction to COVID shot, fever, Panic Disorder-- ER. Medical Center Discharge summary diagnosis: Adverse reaction to the vaccine, acute anxiety. Reportable patient symptoms at, 1st visit : fever, shaking stomach cramps, breathing issues. Medical Center -- No fever, confusion and dementia type, patient would not stay in patient bed; patient would get up and sit down again repeatedly, agitated and anxious. Attempted to urinated hospital bed. Patient committed suicide in home.		No prior vaccinations for this event.
	ABDOMINAL PAIN UPPER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
She had the first dose of Pfizer vaccine at the Campus on Friday 1/15 at 4:30 pm. After the vaccine, she		No prior vaccinations for

had no new symptoms or signs of vaccine reaction and MD friend reports that he checked her pulse which was not elevated from baseline. On 1/16, she awakened and continued to feel at her recent baseline. However, in the early afternoon, she complained of headache, nausea/epigastric pain, and chest heaviness. These apparently were not unusual symptoms for her to feel intermittently. Per her niece, who has a home O2 sat device, her 02 sat that morning was 97 with a HR of 87 irregularly irregular. She was afebrile. (continue on page 2)

this event.

Pt passed soon after; shortly after progressed with other covid symptoms and was admitted / acute resp failure, COVID pneumonia; acute resp failure, COVID pneumonia; Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle.; Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle.; Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle.; This is a spontaneous report from a non-contactable Pharmacist. A 76-years-old non-pregnant female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE lot number EL3247), intramuscular on 19Jan2021 at single dose for COVID-19 immunisation. The patient medical history included COVID symptoms from 16Jan2021 and ongoing. Concomitant medications were not reported. The patient with acute resp failure, COVID pneumonia, that developed symptoms 9 days prior to admit and ultimately received first vaccine 6 days prior to a admit, then shortly after progressed with other covid symptoms and was admitted on 25Jan2021. She decompensated while intp and was transferred to ICU for rising O2 needs, ultimately had to be intubated. Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle. Sx and IR consulted and did beside exploration of hematoma. Initially blood pressure responded but overnight continued with refractory hypotension. Maxed out vasopressin and levophed, hemodynamics deteriorated. The patient died on 02Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible. No further information is expected.; Sender's	No prior vaccinations for this event.

Comments: Based on temporal association, the causal relationship between bnt162b2 and the events death, COVID-19 pneumonia, acute respiratory failure, hypotension, abdominal wall haematoma and abdominal wall haemorrhage cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pt passed soon after

67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

ACIDOSIS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

For the two days prior to presentation the patient had been complaining of chest pain, his breathing seemed to be labored Monday. He and the family thought the pain was due to shingles as he carried this diagnosis from a month ago. Patient had also received the COVID vaccine 2 days prior to presentation and assumed he was feeling unwell due to the vaccine. Family wanted to take him to the hospital yesterday and earlier today but he refused. She left him in his home earlier this afternoon prior to presentation and returned to check on him finding him unresponsive and apneic at which time EMS was activated. #cardiac arrest -- suspect primary cardiac given collateral from family at home, consider hypoxemia which was corrected with advanced airway and 100% FiO2, patient clinically euvolemic and with soft brown stool in diaper not suggestive of GI hemorrhage, attempt to address acidosis with CPR and bicarbonate, not hypoglycemia, on

Resident has increase weakness and lethargy with abnormal labs. He was transferred to the ER. He was admitted to the hospital and treated for worsening AKI and hypotension.	No prior vaccinations for this event.
ACUTE KIDNEY INJURY	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.	No prior vaccinations for this event.
ACUTE KIDNEY INJURY	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient, who was a pharmacist, developed fatigue and shortness of breath hours after receiving vaccine. Two days later, on 01/28/2021, the patient went to local urgent care for worsening shortness of breath and was referred to Hospital for worsening dyspnea and hypoxia. The patient was admitted to the hospital We was found to have bilateral pulmonary infiltrates and treated for pneumonia with Rocephin and azithromycin. He was tested for COVID-19 multiple times, but each of the results were negative. Despite the negative results, there was high clinical suspicion for COVID-19 and the patient was started on Remdesivir and Decadron. The patient's oxygen requirements continued to worsen and the patient was transferred to another	No prior vaccinations for this event.

facility for higher level of care. There his hypoxia worsened and he required mechanical ventilation. Patient then developed hypotension and required vasopressors for blood pressure support. Furthermore, patient developed acute renal failure requiring hemodialysis. Despite mechanical ventilation with FiO2 100%, and for vasopressors, patient clinically deteriorated and family decided to palliatively extubate on 02/05/2021.

ACUTE KIDNEY INJURY	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient had Covid-19 in October of 2020. He recovered. He received the vaccination on 12/30/2020 with no complaints. On 01-05-2021 it was noted to he was incontinent of urine and bilateral lower extremity edema. Lab work was completed showed acute kidney injury. He had decreased blood pressure and oxygen saturations on 01-06-2021 He was admitted to the hospital with rapid progression of symptoms and suggested multi-system failure. He had a long cardiac history. On 01-14-2021 he passed away with a diagnosis of Cardiomyopathic CHF, A.Fib contributory.	No prior vaccinations for this event.
ACUTE KIDNEY INJURY	**COVID19 (COVID19 (MODERNA)) (1201)**
Admitted to hospital with sob upon exertion that started prior to vaccine. Hx COPD, HTN, CKD, hyperlipidemia, bladder cancer in remission. Stated he has been taking Eliquis and Xarelto between renal doctor and cardiologist Dr. Anticipating going home 2/5/21 but then turned blue and stopped breathing under a DNR. COVID test negative. Labs show acute on chronic renal failure with an elevated troponin likely from demand ischemia.	No prior vaccinations for this event.
ACUTE KIDNEY INJURY	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt presents to ER with increased weakness, hypoxia, history of COPD, but not oxygen dependent., hypotension. Acute Kidney failure noted in labs, not previously diagnosed , new hyperkalemia. BP 73/39, HR	No prior vaccinations

67. dopamine initiated, and switched to Levophed. Oxygen Sat 86%, requiring 10 L O2. Transferred from this critical access hospital to another Hospital. Expires later 2-13-2021	for this event.
ACUTE KIDNEY INJURY	**COVID19 (COVID19 (MODERNA)) (1201)**
ER visit 1/25/21 patient walked into a prompt care and collapsed, witnessed and pulseless CPR with ROSC after 6-7mins, no shock no meds. Awake and speaking upon arrival to ER. 2 plus pitting edema ble ER diagnosis Anasarca, cardiac arrest, hypotension, elevated troponin I levels, Acute kidney injury and syncope. ACUTE KIDNEY INJURY	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP	No prior vaccinations for this event.

support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.		
	ACUTE KIDNEY INJURY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
PATIENT GOT HER FIRST COVID PFIZER VACCINE AT 12/31 IN THE AM. HAD GOTTEN FLU LIKE SYMPTOMS AND HAD BEEN SICK FOR A COUPLE OF DAYS. HAD NAUSEA AND VOMITTING DURING THIS TIME AS WELL. ON 1/3 THE CARE GIVER WENT TO CHECK ON HER PT AT HER LTC FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.		No prior vaccinations for this event.
	ACUTE KIDNEY INJURY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer.		No prior vaccinations for this event.

Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.

ACUTE KIDNEY INJURY		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt received vaccine on 7 jan. 2021 Twelve days later, on 19 January 2021, Pt developed symptoms of COVID (cough, sore throat, fever, myalgias), on 20 Jan, pt admitted to hospital for worsening symptoms. Pt tested positive for COVID 19. Pt admitted to ICU where pt had complicated hospital course to include ARDS secondary to COVID pneumonia, nonSTEMI, with biventricular heart failure, on multiple pressor, rhabdomyolysis with acute kidney injury, requiring CRRT. Pt was in hospital for 10 days; he passed away on 31 Jan 2021.	No prior vaccinations for this event.	

ACUTE MYELOID LEUKAEMIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident expired on 1/23/21 . Resident receiving care under hospice ,diagnosis Acute Myeloid Leukemia.	No prior vaccinations for this event.	

ACUTE MYELOID LEUKAEMIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Fall; fatigued; arm pain; AML; Sepsis secondary to AML; This is a spontaneous report from a contactable consumer. An 88-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19	No prior vaccinations	

VACCINE, lot# EL3249), via an unspecified route of administration on 19Jan2021 17:30 in right arm at single dose for covid-19 immunization. Medical history included hypertension, hyperlipidemia, OA (osteoarthritis), cognitive impairment. No other vaccine in four weeks was administrated. Concomitant medication in two weeks included atorvastatin, aspirin, calcium, gabapentin, losartan and memantine hydrochloride (NAMENDA). The patient previously took lisinopril and tetracycline and both experienced allergies. The patient had no covid prior vaccination. The patient initially had no symptoms but arm pain in Jan2021, no bleeding or bruising from injection. On 31Jan2021 19:00, patient felt fatigued. Patient suffered fall on 01Feb2021. She was admitted to hospital. All cell lines were down in Feb2021. She was diagnosed with AML (acute myeloid leukemia) in 2021. She expired 07Feb2021. Events resulted in emergency room/department or urgent care, hospitalization, life threatening illness (immediate risk of death from the event) and patient died. The patient received the treatment of blood and platelet transfusions, bone marrow biopsy, cytogenetic testing, antibiotics, intubation for events. The patient died on 07Feb2021 due to sepsis secondary to AML. An autopsy was not performed. Outcome of events were fatal.; Reported Cause(s) of Death: arm pain; fatigued; fall; Sepsis secondary to AML; Sepsis secondary to AML	for this event.

ACUTE MYOCARDIAL INFARCTION	**COVID19 (COVID19 (MODERNA)) (1201)**
pt received vaccine on 2/3. early on 2/4 developed chest pain, dyspnea, and was seen in ED and diagnosed with acute exacerbation of CHF and NSTEMI type 2, and anemia. on 2/5 transfusion was started and pt developed worsening dyspnea and then PEA arrest. Pt achieved ROSC and was transferred to the cardiac intensive care unit where he required vasopressor support. he subsequently declined and died on 2/7	No prior vaccinations for this event.

ACUTE MYOCARDIAL INFARCTION	**COVID19 (COVID19 (MODERNA)) (1201)**
"The decedent experienced severe chest pain and dyspnea approximately nine days following the first series of the vaccine. He reported to family members that he was having a ""severe reaction"" to the	No prior vaccinations for this event.

vaccine and believed it was acute pericarditis due to the same symptoms he experienced prior. He reported that on 2/1/21 around 0300 hours, the symptoms were the most severe and he was going to seek medical attention, but did not. He waited till the convenient store opened and purchased OTC Tylenol for relief of symptoms. He continued to have dyspnea and chest pain up until 2/9/21, when he called 911 complaining of chest pain and was found to have a STEMI; subsequently died at Hospital in the ER."

ACUTE PULMONARY OEDEMA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
within 24 hours after her second injection she developed chills, had a syncopal episode and had, difficulty breathing. this progressed over the next day when she had a second syncopal episode and her dyspnea and confusion worsened EMT was called and she was brought to the hospital. she was in flash pulmonary edema and with her history of severe aortic stenosis she was admitted to the cardiac icu. she had no prior history up to that time of pulmonary edema and was functioning without distress in her home. she had a history of covid in early april, manifesting primarily as severe confusion, from which she recovered.		No prior vaccinations for this event.
ACUTE RESPIRATORY DISTRESS SYNDROME		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received the Moderna COVID vaccine 1/28/21. He was tested for COVID 19 on 1/29/31. Results were received 1/30/21, at which time he was evaluated and found to be hypoxic with tachycardia. He was sent to the local ER and returned this same day. On 2/2/21, he was evaluated by the provider, who sent him to the emergency room with acute respiratory distress and poor O2 sats		No prior vaccinations for this event.
ACUTE RESPIRATORY DISTRESS SYNDROME		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient was vaccinated on 1/14/2021. On 1/22/2021, patient tested positive for COVID-19 and admitted to the		No prior vaccinations

hospital for acute hypoxemic respiratory failure, COVID-19 pneumonia, and severe ARDS. Patient was intubated on 1/23/2021 and later died on 2/10/2021 after being extubated and placed on comfort measures.	for this event.
ACUTE RESPIRATORY DISTRESS SYNDROME	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.	No prior vaccinations for this event.
ACUTE RESPIRATORY DISTRESS SYNDROME	**COVID19 (COVID19**

	(PFIZER-BIONTECH)) (1200)
Pt received vaccine on 7 jan. 2021 Twelve days later, on 19 January 2021, Pt developed symptoms of COVID (cough, sore throat, fever, myalgias), on 20 Jan, pt admitted to hospital for worsening symptoms. Pt tested positive for COVID 19. Pt admitted to ICU where pt had complicated hospital course to include ARDS secondary to COVID pneumonia, nonSTEMI, with biventricular heart failure, on multiple pressor, rhabdomyolysis with acute kidney injury, requiring CRRT. chronic hypoxia respiratory failure; Unresponsive; A spontaneous report was received from Pfizer concerning a 51-year old, male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and had	No prior vaccinations for

developed hypoxia a sudden death. The patient's medical history was not provided. No relevant concomitant medications were reported. On 07 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (lot/batch: unknown) for prophylaxis of COVID-19 infection. On 07 Jan 2021, around 6:00 pm, the patient became increasingly hypoxic. He was transported to the hospital for acute on chronic hypoxia respiratory failure. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Jan 2021 at 11:25pm. The cause of death was not provided/unknown. Plans for an autopsy were unknown/not provided.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death		this event.
	ACUTE RESPIRATORY FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident was vaccinated on 12/31/20. Then on 1/14/21 he tested positive for SARS-CoV-2 on routine surveillance PCR testing. Another resident on the same hall was COVID positive on 1/11/21. Results of the PCR test were obtained on 1/16/21. He appeared asymptomatic at that time. Given his COVID positive status, all aerosol generating procedures had to be stopped. Overnight on 1/16/21 into 1/17/21, he had the onset of acute respiratory failure and was transported to the hospital. Per notes, he was put on BiPAP for several hours, but his CO2 level did not improve. Per prior advance directives completed with the resident and his two brothers, he had DNR/DNI orders. The hospital physician spoke with his brother and the decision was made to move to comfort care. He was discharged to inpatient hospice and died around 4pm on 1/18/21. This outcome does not appear to be vaccine-related, but death from COVID-19 infection is listed as a reportable event following COVID-19 vaccination.		No prior vaccinations for this event.
	ACUTE RESPIRATORY FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

According to medical report, Pt presented to the ED on 1/14/21 w/ cc of SOB for 1 day. She received her COVID-19 vaccine on 1/9/21. Pt stated that she developed a dry hacking cough 2 days prior to the vaccine on 1/7/21. Over the last few days prior to admission, she developed generalized weakness, SOB, loss of sense of taste and smell w/ associated decreased appetite and nausea ultimately SOB in the24 hours prior to admission. Final Diagnosis- acute hypoxic respiratory failure secondary to COVID-19 pneumonia. Pt died on 2/3/21. See Medical report for more information.	No prior vaccinations for this event.
ACUTE RESPIRATORY FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt with acute resp failure, COVID PNA, that developed symptoms 9 days prior to admit and ultimately received first vaccine 6 days prior toa admit, then shortly after progressed with other covid symptoms and was admitted. She decompensated while intp and was transferred to ICU for rising O2 needs, ultimately had to be intubated. Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle. Sx and IR consulted and did beside exploration of hematoma. Initially blood pressure responded but overnight continued with refractory hypotension. Maxed out vasopressin and levophed, hemodynamics deteriorated. Pt passed soon after(2/2).	No prior vaccinations for this event.

Pt passed soon after; shortly after progressed with other covid symptoms and was admitted / acute resp failure, COVID pneumonia; acute resp failure, COVID pneumonia; Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle.; Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle.; Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle.; This is a spontaneous report from a non-contactable Pharmacist. A 76-years-old non-pregnant	No prior vaccinations for this event.

female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE lot number EL3247), intramuscular on 19Jan2021 at single dose for COVID-19 immunisation. The patient medical history included COVID symptoms from 16Jan2021 and ongoing. Concomitant medications were not reported. The patient with acute resp failure, COVID pneumonia, that developed symptoms 9 days prior to admit and ultimately received first vaccine 6 days prior to a admit, then shortly after progressed with other covid symptoms and was admitted on 25Jan2021. She decompensated while intp and was transferred to ICU for rising O2 needs, ultimately had to be intubated. Became hypotensive due to massive hamatoma 2' bleeding into abd rectus muscle. Sx and IR consulted and did beside exploration of hematoma. Initially blood pressure responded but overnight continued with refractory hypotension. Maxed out vasopressin and levophed, hemodynamics deteriorated. The patient died on 02Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the events death, COVID-19 pneumonia, acute respiratory failure, hypotension, abdominal wall haematoma and abdominal wall haemorrhage cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pt passed soon after

ACUTE RESPIRATORY FAILURE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she

No prior vaccinations for this event.

had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

ACUTE RESPIRATORY FAILURE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect

No prior vaccinations for this event.

d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

ADENOVIRUS TEST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
loss of consciousness Narrative: Patient received COVID-19 vaccine dose #1 on 1/6/21 w/o complications. Per 1/6/21- 1/9/21 nursing notes, patient did not experience any injection site reactions, denied pain or tenderness at injection site, no dizziness, no n/v, remained afebrile. Around 1/9/21 @1810, patient became	No prior vaccinations for this event.

acutely nonresponsive after being helped to the edge of bed. Per nurses, he was previously awake/alert, talking and asymptomatic. Patient is DNR/DNI but facility rapid response emergency team called d/t patient's sudden change of condition. Emergency team helped patient into lying position. Per 1/9/21 ICU emergency team note, patient appeared comfortable w/ no palpable radial pulse and had minimal shallow agonal breathing. Pulse ox 94%, HR in 60s per machine. BP unmeasurably low by BP cuffx3. Resident passed at 18:20 pm.

ADJUSTED CALCIUM

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

According to medical report, Pt presented to the ED on 1/14/21 w/ cc of SOB for 1 day. She received her COVID-19 vaccine on 1/9/21. Pt stated that she developed a dry hacking cough 2 days prior to the vaccine on 1/7/21. Over the last few days prior to admission, she developed generalized weakness, SOB, loss of sense of taste and smell w/ associated decreased appetite and nausea ultimately SOB in the24 hours prior to admission. Final Diagnosis- acute hypoxic respiratory failure secondary to COVID-19 pneumonia. Pt died on 2/3/21. See Medical report for more information.	No prior vaccinations for this event.

AGITATION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said	No prior vaccinations for this event.

that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

	AGITATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Vaccinated 2/20. At that time, had symptoms of incarcerated hernia, went to ED for evaluation. Not felt to warrant hospital admission. Returned two days later with agitation, altered mental status, and incarceration. Went to OR, uncomplicated hernia repair. Postoperatively, did not recover mental status. Went into arrythmias POD 4, hypotension ensued, had multiple interventions and evaluations without satisfying answers for clinical course.		No prior vaccinations for this event.
	AGONAL DEATH STRUGGLE	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).		No prior vaccinations for this event.
	AGONAL RHYTHM	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient found down at home with agonal respirations and per EMS asystole, received 2 rounds of epi at her house with return of spontaneous pulses, lost pulse again in route to ER and another round of epi was given,		No prior vaccinations

CPR in progress when arrived at hospital. Prior to this patient's husband states he heard her fall in the bathroom but did not immediately check on her as he states that this has happened before. He checked on her 10 min later and that's when he found her unconscious. Daughter called 911 and she began CPR. No previous complaints of headache, chest pain, back pain, fever or chills. Husband states patient was drinking that evening which is not unusual for her. Patient died at hospital.	for this event.	
AGONAL RHYTHM		**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.	No prior vaccinations for this event.	
AGONAL RHYTHM		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was	No prior vaccinations for this event.	

stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

AIRWAY SECRETION CLEARANCE THERAPY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient has been under Hospice services for almost a year. She began to demonstrate a large amount of oral secretions on 1/10/21 at 2130. She was suctioned and a Rapid COVID-19 test was performed, which was negative. The COVID-19 Rapid test was repeated on 1/11/21 and was positive. Oxygen saturation was noted to be 78% on 1/12/21, and oxygen was initiated at 1133 at 3L per nasal cannula. Oxygen was increased to 4L at 1635 d/t shortness of breath. On 1/15/21 @ 0645 patient was unresponsive and without vital signs. Orders were for DNR and CPR was not initiated.	No prior vaccinations for this event.
AIRWAY SECRETION CLEARANCE THERAPY	**COVID19 (COVID19 (PFIZER-BIONTECH))**

(1200)

After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for	No prior vaccinations for this event.

a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

ALANINE AMINOTRANSFERASE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration	No prior vaccinations for this event.

pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further

Fever 101.1, unresponsive episode. Transferred to Hospital on 1/28. Diagnosis there was anemia and CHF, aware that he had vaccine day prior. Transfused with 2 units pRBC's. Transferred back to Nursing Home on 1/30 and passed away 0140 1/31/2021	No prior vaccinations for this event.
ANAEMIA	**COVID19 (COVID19 (MODERNA)) (1201)**
pt received vaccine on 2/3. early on 2/4 developed chest pain, dyspnea, and was seen in ED and diagnosed with acute exacerbation of CHF and NSTEMI type 2, and anemia. on 2/5 transfusion was started and pt developed worsening dyspnea and then PEA arrest. Pt achieved ROSC and was transferred to the cardiac intensive care unit where he required vasopressor support. he subsequently declined and died on 2/7	No prior vaccinations for this event.
ANAEMIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Received Moderna #1 on 1/12/2021. 1/15/2021 developed worsening shortness of breath. Went to hospital and diagnosed with anemia, 4 negative fecal tests, neg EGD and colonoscopy. Discharged and readmitted (circumstances unknown for this episode) then readmitted a third time 1/20/2021 for shortness of breath. Diagnosed covid + at third hospitalization and continued to get worse. He died 1/23/2021.	No prior vaccinations for this event.
ANAEMIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report	No prior vaccinations for this event.

she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

	ANAEMIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom only had site soreness after her covid vaccine on 1/21 which resolved within a couple days. However, she died in the early morning hours of 1/25, she was fine the day before, no sign of injury. We found her collapsed on the ground and although we tried cpr she was already dead. She had gone to the hospital on 12/28 for shortness of breath, angina and symptomatic anemia, her ekg was unchanged and blood work normal except for anemia. The cardiologist did not think a cardiac cath was needed. Her shortness of breath improved with a blood transfusion and a dose of lasix (no heart failure).		No prior vaccinations for this event.

elevated lactate, anemia and elevated d-dimer. Pt reports getting SOB getting up to go to the bathroom. Pt was intubated. He developed pulmonary edema. Pt expired on 02-02-2021 at 10:13 PM.

ANAEMIA MACROCYTIC	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg	No prior vaccinations for this event.

of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well.

Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure""""

ANAL INCONTINENCE

COVID19 (COVID19 (MODERNA)) (1201)

The patient passed away today, 1/13/2021. She was a hospice patient. She showed no adverse effects after receiving the vaccine on 1/12/2021. This morning she woke up as normal and during her morning shower she had a bowel movement, went limp and was non-responsive. The patient passed away at 7:45 am.

No prior vaccinations for this event.

ANAL INCONTINENCE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated at 11:30am. By 7pm he started presenting symptoms of fatigue, chest pain. Patient urinated and defecated in himself. Was not feeling well. Patient died at 10:30pm.

No prior vaccinations for this event.

Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain	No prior vaccinations

which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.	for this event.
ANAPHYLACTIC REACTION	**COVID19 (COVID19 (MODERNA)) (1201)**
Brain aneurysm; Anaphylactic reaction; Collapsed; BP sky rocketed; Shortness of breath; A spontaneous report was received from a consumer concerning a 69-year-old female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and experienced blood pressure skyrocketed, shortness of breath, loss of consciousness, massive anaphylactic reaction, and brain aneurysm. The patient's medical history, as provided by the reporter, included high blood pressure and arthritis. Products known to have been used by the patient, within two weeks prior to the event, included an antihypertensive. On 04 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. Twenty-two minutes later she had a massive anaphylactic reaction. She experienced shortness of breath, blood pressure skyrocketed, and loss of consciousness. She was taken to the emergency room. The patient had a brain aneurysm and never recovered. No treatment information was provided. The patient died on 04 Jan 2021. The cause of death was reported as brain aneurysm. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns a 69-year-old, female patient with a medical history of hypertension, who experienced fatal, serious, unexpected events of Anaphylactic reaction, hypertension, dyspnea, loss of consciousness and brain aneurysm. The events occurred 22 minutes after the first dose of mRNA-1273 was administered. No treatment information was provided. The patient never recovered and died. The cause of death was reported as brain aneurysm. Very limited information regarding this event has been provided at this time. Based on temporal association between the	No prior vaccinations for this event.

use of the product and the start date of the event, a causal relationship cannot be excluded. Additional information has been requested.; Reported Cause(s) of Death: Brain aneurysm

ANAPHYLACTIC SHOCK **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

She started having breathing problems/heart attack appearance. on 1/22/21 and went to the ER. Upon admittance was told it was an anaphylactic shock from the Covid shot. They kept her in ICU and released her 1/23/21. At 12:45 am on 1/24/21 she passed out and we called the ambulance. Hospital admitted her and worked through multiple organ failure issues and thought her numbers were under control. She was released on 1/27/21 and was driving on 1/28/21 around 4:15 pm and appears to have had heart failure and had a wreck. She passed away that day. No prior vaccinations for this event.

ANEURYSM **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

on 1/8/2021 17:30 patient taken to ER, cerebellar hemorrhage, stroke, aneurysm No prior vaccinations for this event.

ANEURYSM RUPTURED **COVID19 (COVID19 (MODERNA)) (1201)**

Patient received her first dose of the Moderna COVID-19 Vaccination on Saturday January 16th 2021 at approximately 12pm. She completed all necessary screening forms and was deemed to be at low risk for serious allergic reactions. She tolerated the vaccination well, and no complications or immediate adverse events occurred. She was observed for a full 15 mins per CDPHE/CDC guidelines and left the Clinic in stable condition after her observation period was complete. On the morning of Tuesday, January 19th, 2021, the patient was found unconscious and unresponsive by her husband. She was transferred by Ambulance to Hospital shortly thereafter. She was diagnosed with a brain bleed that was determined to be No prior vaccinations for this event.

inoperable. She was transferred to other Hospital for higher level care. She was seen by neurosurgery and diagnosed with a ruptured aneurysm. She was treated in the ICU for 24 hours, at which point her team determined that the severity of her brain bleed would not respond to treatment. Supportive cares were withdrawn on Wednesday Jan 20th, and she passed away shortly thereafter.

ANGINA PECTORIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1-12-21 Resident is complaining of heart pain. Resident blood pressure is 228/105. 1-22-21 Dx UTI 1-13-21 His nurse called MD at approximately 0645, reported to him that it was reported to this nurse that resident has not slept in 2 days and night, has an increased blood pressure, reports severe pain in lower back, and appears to be uncomfortable Resident is able to verbalize his pain and where it is at, but is unable to explain the quality of the pain or give a number on the 0/10 pain scale. ANGIOGRAM PULMONARY ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Patient presented to the Emergency Department complaining of chest pain, pale, cool diaphoretic, and hypotensive. The patient was discovered to have a large saddle pulmonary embolism, went into cardiac arrest and expired. Of note, the patient received her second Moderna COVID vaccine on 1/23, which would place her first one approximately 12/25 if she received them at the appropriate interval. This information is from the patient's daughter and the ED record, the information is not available in CAIR. Per the daughter, the patient started feeling ill on 1/21, improved on 1/25, and then acutely worsened on 1/27, resulting in the ED visit.

No prior vaccinations for this event.

ANGIOGRAM PULMONARY ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.

No prior vaccinations for this event.

ANGIOGRAM PULMONARY ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive.

No prior vaccinations for this event.

EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.

ANGIOGRAM PULMONARY ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.

No prior vaccinations for this event.

ANGIOGRAM PULMONARY NORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

No prior vaccinations for this event.

ANION GAP

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer,

No prior vaccinations for this event.

however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

ANOSMIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
According to medical report, Pt presented to the ED on 1/14/21 w/ cc of SOB for 1 day. She received her COVID-19 vaccine on 1/9/21. Pt stated that she developed a dry hacking cough 2 days prior to the vaccine on 1/7/21. Over the last few days prior to admission, she developed generalized weakness, SOB, loss of sense of taste and smell w/ associated decreased appetite and nausea ultimately SOB in the24 hours prior to admission. Final Diagnosis- acute hypoxic respiratory failure secondary to COVID-19 pneumonia. Pt died on 2/3/21. See Medical report for more information.		No prior vaccinations for this event.
ANTICONVULSANT DRUG LEVEL DECREASED		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received vaccine at Public Health Clinic. Patient ended up having a seizure 3 days later and ended up in the hospital. Found to have right lobe pneumonia and low depakote level. Patient noted to have multiple seizures at hospital, issues with stabilizing HR and BP, and passed away on 1/20/21.		No prior vaccinations for this event.
ANURIA		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Pale, not eating, no urine output After 1st covid vaccine

ANXIETY **COVID19 (COVID19 (MODERNA)) (1201)**

"The patient came to the Emergency Room at approx 3:30 am on 02/03/2021 with pain in right arm (same arm the COVID vaccine had been administered in approx 12 hours earlier) and feeling generally unwell. Patient was concerned about possibility of gout flare or that something was wrong with her arm. Elevated blood pressure was noted; this was attributed to anxiety. She was evaluated, given 500 mg Tylenol, and discharged since the pain was decreasing and blood pressure was stabilized. Patient instructed to follow-up with physician. The next day, on 02/04/2021, the patient arrived at the Emergency Room by ambulance; cardiac arrest was the chief complaint. The patient's daughter stated the patient had been ""feeling generally poor and then suddenly collapsed."" Daughter described ""gurgling respirations"" and being unresponsive. 911 was called, police arrived within 5 minutes and initiated CPR. Epinephrine, atropine, lidocaine and bicarb administered after arrival to Emergency Room. Shockable rhythm never demonstrated. Patient never recovered spontaneous respiration or movement. The death was called at 23:04. Coronary artery disease with cardiac arrest is the cause from the ER records; the coroner is putting COVID-19 vaccination in Part 1 of the death certificate."

No prior vaccinations for this event.

ANXIETY **COVID19 (COVID19 (MODERNA)) (1201)**

Patient described feeling nervous, anxious the next morning (Wednesday) after the vaccine. He later fell in the bathroom after using the restroom, his legs gave out (his words) and consequently was on the ground for 23 hours before being transported to the hospital. That was Thursday afternoon. He was diagnosed with COVID-19 on Saturday night and died the following Friday morning.

No prior vaccinations for this event.

ANXIETY **COVID19 (COVID19 (MODERNA)) (1201)**

Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse	No prior vaccinations for this event.

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of		No prior vaccinations for this event.

chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness.	No prior vaccinations for this event.

He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is

elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

AORTIC ANEURYSM	**COVID19 (COVID19 (MODERNA)) (1201)**
"Patient called EMS approximately 1pm on 2/15 with complaints of generalized weakness. Upon arrival EMS found her to be diaphoretic and she had a witnessed syncopal episode with question of v-fib and seizures. She became unresponsive and had no pulse. CPR was begun and she was transported to ED. She remained asystole throughout. CPR was initially continued in the ED for approximately 30 minutes and then stopped with Time of Death noted at 13:27. ED notes noted ""suspect given history that patient experienced massive MI, PE or ruptured AAA"". Death certificate notes indicate ""signficant conditions contributing to death after cardiac arrest; ASCVD""."	No prior vaccinations for this event.

My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.		No prior vaccinations for this event.

bowel perforation; pain in her upper abdomen; This is a spontaneous report from a contactable consumer. An 86-year-old female patient received the 2nd dose of bnt162b2 (BNT162B2) at single dose on 13Jan2021 for Covid-19 immunisation, administerd at nursing home/senior living facility Medical history included dementia, arthritis. No known allergies. Patient was not pregnant. Patient had not COVID prior vaccination. Concomitant medication in 2 weeks included: memantine (manufacturer unknown) 10 mg BID, diclofenac (manufacturer unknown) BID, carbidopa, levodopa (manufacturer unknown) 25-100 mg TID, quetiapine (manufacturer unknown) 12.5 mg q HS, escitalopram oxalate (LEXAPRO) 10 mg q HS, paracetamol (TYLENOL) 650 mg BID, glucosamine (manufacturer unknown) drink. The patient received the 1st dose of bnt162b2 (BNT162B2) at single dose on 24Dec2020 for Covid-19 immunisation. No other vaccine received in 4 weeks. The patient experienced bowel perforation and pain in her upper abdomen on 18Jan2021 07:30. The events resulted in Emergency room/department or urgent care, Life threatening illness (immediate risk of death from the event), and death. On 18Jan2021 07:30 AM, less than a week after the second shot, she had pain in her upper abdomen and was taken to the ER on 18Jan2021. CT showed a bowel perforation in the small bowel. She had never had bowel surgery or diverticulitis. She had been healthy other than her dementia and arthritis. Patient received treatment for the events: hospice and pain management. COVID-19 was not tested post vaccination. The cause of death was bowel perforation. An autopsy was not performed. Information about lot/batch number has been requested.; Reported Cause(s) of Death: bowel perforation	No prior vaccinations for this event.

APPETITE DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

AREFLEXIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care	No prior vaccinations for this event.

with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

ARRHYTHMIA

COVID19 (COVID19 (MODERNA)) (1201)

Clients wife reported on 1/18/2021, that her husband died unexpectedly the day after receiving the COVID 19 vaccine. I called and spoke with her. She stated that the client had started experienced some tightness in his chest the evening of 1/11/2021. She stated that it was normal for him to have the tightness in his chest if he got stressed. She stated that she found him on the garage floor on 1/12/2021 at 2120. He was taken by ambulance to the hospital. She stated that the hospital told her that his COPD had caused him to go into arrythmia.

refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

ASPARTATE AMINOTRANSFERASE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
PATIENT GOT HER FIRST COVID PFIZER VACCINE AT 12/31 IN THE AM. HAD GOTTEN FLU LIKE SYMPTOMS AND HAD BEEN SICK FOR A COUPLE OF DAYS. HAD NAUSEA AND VOMITTING DURING THIS TIME AS WELL. ON 1/3 THE CARE GIVER WENT TO CHECK ON HER PT AT HER LTC FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.	No prior vaccinations for this event.

ASPARTATE AMINOTRANSFERASE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an	No prior vaccinations for this event.

Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

ASPARTATE AMINOTRANSFERASE INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.

No prior vaccinations for this event.

ASPARTATE AMINOTRANSFERASE INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"	No prior vaccinations for this event.
ASPARTATE AMINOTRANSFERASE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into	No prior vaccinations for this event.

full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of

pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

I video chatted with her Thursday after receiving the vaccine. My mom was in poor health but she was talking in complete sentences and responded appropriately. She was upright in bed and made eye contact. She smiled and denied pain. By Sunday, she was extremely weak and unable to sip water with a straw. Her health had changed dramatically and rapidly. She moaned in pain and was very fatigued. Her condition continued to deteriorate over the week and she stopped talking and was constantly sleeping. They started antibiotics for the oozing cancer lesion and then morphine for pain and end of life care. She passed away on January 22nd which was 15 days post vaccination. ASTHENIA	COVID19 (COVID19 (MODERNA)) (1201)
"Patient called EMS approximately 1pm on 2/15 with complaints of generalized weakness. Upon arrival EMS found her to be diaphoretic and she had a witnessed syncopal episode with question of v-fib and seizures. She became unresponsive and had no pulse. CPR was begun and she was transported to ED. She remained asystole throughout. CPR was initially continued in the ED for approximately 30 minutes and then stopped with Time of Death noted at 13:27. ED notes noted ""suspect given history that patient experienced massive MI, PE or ruptured AAA"". Death certificate notes indicate ""signficant conditions contributing to death after cardiac arrest; ASCVD""."	No prior vaccinations for this event.

ASTHENIA	COVID19 (COVID19 (MODERNA)) (1201)
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also	No prior vaccinations for this event.

question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

ASTHENIA

COVID19 (COVID19 (MODERNA)) (1201)

On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.

	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An 85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19		No prior vaccinations for this event.

immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything, nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30 (on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went

out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart stopped"

	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My father was in weak condition to begin with. He didn't get out of bed for the next few days after receiving the vaccine. The little amount that he ate was consumed in bed. He began aspirating his food which lead to pneumonia. He wasn't strong enough to fight off the pneumonia even with antibiotics. He died on 1/23/21. While he might have passed soon in any case, I believe that the vaccine may possibly have increased his weakness/exhaustion thereby hastening his demise.		No prior vaccinations for this event.
	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Called PCP, from the note: I got my shot on Jan 19. But last Friday I have been down with a horrible flu. I'm wearing diapers because of uncontrollable diarrhea. I can't leave my sofa to walk over to my desk because I'll be so out of breath. I have a cough that produces a pink or gold Phelm I have dry mouth. I have no appetite I'm so weak and have lost 15 pounds. Don't know what to do. My next Covid is shot is feb 11 Called employer on 2/3/21 but hung up. Tried calling multiple times to follow up. In triage she stated she had a COVID test scheduled and had spoken with her PCP. COVID test through PCP: 2/4/21 She passed away the night of 2/4/21		No prior vaccinations for this event.

	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there.		No prior vaccinations for this event.

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids	No prior vaccinations for this event.	

were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. 	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
The individual received the vaccine around 12:00pm on 02/11/21. Around 9pm the individual went to lay down on the couch at home and started to have difficulty breathing. Within 30 minutes the individual became week and unresponsive. She was transported to the hospital where she was pronounced deceased at 11:44 pm on 02/11/21.	No prior vaccinations for this event.	

	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Adverse reaction to the vaccine started with variable weakness beginning 1/29/2021. On 1/30/21 around 8:30pm, he needed assistance in the bathroom related to weakness and had what was later identified as a stroke with left side weakness and slurred speech. In accordance with his wishes, he had care at home. Due to his advanced age and frailty, a CT scan was not pursued. The 325 mg of aspirin that he was previously taking daily was discontinued. After the stroke, he needed total care. Hospice was established at home. Nursing assistant care was delivered by daughter. Death followed 9 days later (2/9/2021).	No prior vaccinations for this event.	

	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient had no energy in the first 24 hours and then began a steady decline that started with vomiting after 48 hours, then an inability to swallow and ultimately the patients death on 2/5/21.		No prior vaccinations for this event.
	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident had slight/slow decline in health prior to vaccine but continued to be able to walk around with walker at community. The day of the vaccine she had a fever. 2 days after vaccine resident did not get out of bed all day and refused to eat. She had small amounts of orange juice as her blood sugar level was low due to not eating. Resident was diagnosed with a UTI and began an oral antibiotic. 3 days after and on day 5 after vaccine resident began feeling weak and had a fall on each day. The following day again resident spent the day in bed. The next day she was quite restless, was on the edge of her bed attempting to self transfer often throughout the day. Resident continued to be restless on the 10th of Feb, had further decline on the 11th of Feb. Resident passed away early the AM of Feb. 12th.		No prior vaccinations for this event.
	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"The day after the 2nd shot, patient developed blisters on his lips and mouth. The care facility said that he had a nut allergy -- but he had never been allergic to nuts. He stopped eating and drinking and his BP had dropped to 60/40. By Jan 16th they called to say he was dying and he passed away on 1/18/21. Patient had COVID19 from Oct 29th - early November. By Nov 21st he had lost 40 lbs. He was 6'3"" and had gone from 189lbs to 149 lbs with COVID. By Nov 21st when we could visit, he had recovered from COVID, but was very thin and weak. He could not bathroom alone and kept falling. He		Shingles - Glaxo 8/22/2020, resulted in hospitalization and LTC.

didn't seem to have a bad reaction to the 1st COVID shot, But he immediately reacted to the 2nd shot and passed away within 6 days."

	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received dose #1 of COVID-19 vaccine on 1/16/21. Within 3 days, she developed petechiae up to ankles, later rising up to her knees. Pt admitted to hospital on 2/6/21 for symptomatic anemia 2/2 vaginal bleeding. Patient received 4 units FFP, 4 units PRBC, 1 unit cryoprecipitate, and vitamin K 5 mg IV. Also started on medroxyprogesterone 20 mg PO TID. Alectinib d/ced due to worsening liver function. Evalauted by OB/GYN and Hematology. Diagnosed with DIC. Patient with worsening bilateral lower extremity edema and purpura with pain and weakness. Palliative care consulted. Patient passed away on 2/11.		No prior vaccinations for this event.

(02/15/2021): vaccine (02/16/2021) : severe body aches and weakness, increased congestion and mucous production. (02/16-17/2021) : death possibly during the night		No prior vaccinations for this event.

	ASTHENIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an		No prior vaccinations for this event.

unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in

the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second

COVID-19 Vaccine.; Reported Cause(s) of Death: Death

presented to ED 1/9/21 with abdominal pain, progressive worsening weakness and fatigue and new onset A fib with RVR likely due to hypertensive urgency . Patient progressed clinically with severe hypoxia and transferred to ICU and started on BiPAP; progressive decline with decreased urinary output with uremia likely secondary to sepsis. Concern with patient worsening clinical decline, palliative care had been consulted on end of life care. Patient expired 1/17/21		No prior vaccinations for this event.
ATRIAL FIBRILLATION		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized		No prior vaccinations for this event.

for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/

slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

ATRIAL FIBRILLATION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

ATRIAL FIBRILLATION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information	No prior vaccinations for this event.

and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

ATRIAL FIBRILLATION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received the vaccine at an outside healthcare facility on 2/11/21. At approximately 1 pm she screamed out and fell out of her chair. EMS was called and patient was found to be in Vfib. ACLS was performed for approximately 42 minutes prior to arrival at ED. At that time the patient had been pulseless for 25 minutes. Patient received 450 mg of amiodarone, epinephrine x7, sodium bicarbonate x2, and 7 AED shocks. In the ED 3 more doses of epinephrine were given, one more dose of sodium bicarbonate, and 5 additional shocks. ROSC was not achieved and time of death was called at 1416.

No prior vaccinations for this event.

ATRIAL FIBRILLATION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Had a stroke 3 days after round one of Covid vaccine and subsequently died the next week due to complications of stroke. Upon admission to hospital, was in afib.	No prior vaccinations for this event.

ATRIOVENTRICULAR BLOCK COMPLETE	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN	No prior vaccinations for this event.

of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.

ATROPHY	COVID19 (COVID19 (MODERNA)) (1201)
"This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21." COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have

"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd		No prior vaccinations for this event.

admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."

BACTERIAL TEST NEGATIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing

BACTERIAL TEST POSITIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT

No prior vaccinations for this event.

cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21

BACTERIAL TEST POSITIVE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested	No prior vaccinations for this event.

DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

BACTERIAL TEST POSITIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation

No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

BALANCE DISORDER

COVID19 (COVID19 (MODERNA)) (1201)

on 1/13/2021 at 3:40am Cliff called for assistance. He lost his balance and had fallen. Cliff refused vitals, refused emergency department, denied hitting his head. As the day progressed patient developed a headache, diarrhea, and vomiting. He again declined the offer for the emergency room. At supper time wife and staff found Cliff unresponsive, 911 was called and he was taken to the emergency department. The ER did a CT scan and found an acute subdural hematoma. Patient was placed on comfort cares and expired at 3pm on 01/14/2021. Cliff did not have a history of falls.

Influenza vaccine 10/06/2020, age 88, fever, chills, vomiting, malaise

BAND NEUTROPHIL PERCENTAGE

COVID19 (COVID19

	(PFIZER-BIONTECH)) (1200)
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.
BAND NEUTROPHIL PERCENTAGE DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.	No prior vaccinations for this event.
BANDAEMIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine	No prior vaccinations for this event.

w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. ""

1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

BASOPHIL COUNT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.

BASOPHIL COUNT INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs	No prior vaccinations for this event.

(see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. "In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff,	No prior vaccinations for this event.

gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

BEDRIDDEN		**COVID19 (COVID19 (MODERNA)) (1201)**
Got vaccine on 1/15/21. He was tired right away, bedridden the next 3 days. He couldn't breathe so he was taken by ambulance on 1/18/21. He was in hospital for several days. put on remdesivir cocktail for 10 days. Slowly getting worse and died in hospital on 1/30/21.		No prior vaccinations for this event.
BEDRIDDEN		**COVID19 (COVID19 (MODERNA)) (1201)**
He developed a fever on 1/8, become unable to swallow and bedbound. He was already end of life and Hospice care at the time of the vaccine.		No prior vaccinations for this event.
BILEVEL POSITIVE AIRWAY PRESSURE		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER		No prior vaccinations

2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from for this event. ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

BILEVEL POSITIVE AIRWAY PRESSURE

COVID19 (COVID19 (MODERNA)) (1201)

Per ED note: Brought in ED by EMS at 1945 for acute shortness of breath and hypotension. Patient was placed on supplemental oxygen and covid test completed. Patient was placed on BiPAP to maintain oxygen greater than 90%. Found to be in metabolic acidosis. Patient became unresponsive and pulse could not be palpated. Chest compressions were initiated. ACLS medications given and pulses regained. Patient lost pulse

No prior vaccinations for this event.

30 mins later and never regained pulse. Per ED noted; likely developed a PE. Passed away at 2127

BILEVEL POSITIVE AIRWAY PRESSURE

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the

No prior vaccinations for this event.

decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

	BILEVEL POSITIVE AIRWAY PRESSURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
12/28/2020: generalized weakness and fell twice at home, cough, nausea,1/04/2021: cough, nausea, fever and chronic pain when she fell from being weak. admitted to hospital with Covid pneumonia, shortness of breath, covid postive, 1/09/2021: pt on bipap, 1/15/2021: pt was intubated, on TPN, pt DNR, 1/18/2021: was extubated and put on comfort measures and passed away		No prior vaccinations for this event.
	BILEVEL POSITIVE AIRWAY PRESSURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
presented to ED 1/9/21 with abdominal pain, progressive worsening weakness and fatigue and new onset A fib with RVR likely due to hypertensive urgency . Patient progressed clinically with severe hypoxia and transferred to ICU and started on BiPAP; progressive decline with decreased urinary output with uremia likely secondary to sepsis. Concern with patient worsening clinical decline, palliative care had been consulted on end of life care. Patient expired 1/17/21		No prior vaccinations for this event.
	BILEVEL POSITIVE AIRWAY PRESSURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was was brought to the ED from facility which he received the vaccine via ambulance with BiPAP, hypoxia, and one dose of Epi of 0.3 mg. He then required intubation, and had struggled with hypoxia, even		No prior vaccinations for

on increasing PEEP. CODE BLUE called in the ED for PEA. He was medicated for such (please see the code run sheet for details), and he came in and out of the code 5 times. After 95 minutes, with the wife at the bedside, and family conference by phone, the code was called, and he was pronounced at 18:20. He received in total 8 me of Epi, 3 shots of Atropine, 3 amps bicarb. He got lasix 40 mg, lovenox 60 mg subcutaneous once. He had a CVC into the right internal jugular, and levophed was started, then Epinephrine drip was started. Prior to the code he got steroids (solumedrol 125 mg, then later decadron 6 mg iv), benadryl iv, antibiotics (ceftraixone / zithromax), and lasix 40 mg. All this time while in the ED, the Rt was at the bedside, and lots of secretions from the lungs were aspirated, bloody color. á Code was the result of PEA secondary to hypoxia (	this event.
BILEVEL POSITIVE AIRWAY PRESSURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident was vaccinated on 12/31/20. Then on 1/14/21 he tested positive for SARS-CoV-2 on routine surveillance PCR testing. Another resident on the same hall was COVID positive on 1/11/21. Results of the PCR test were obtained on 1/16/21. He appeared asymptomatic at that time. Given his COVID positive status, all aerosol generating procedures had to be stopped. Overnight on 1/16/21 into 1/17/21, he had the onset of acute respiratory failure and was transported to the hospital. Per notes, he was put on BiPAP for several hours, but his CO2 level did not improve. Per prior advance directives completed with the resident and his two brothers, he had DNR/DNI orders. The hospital physician spoke with his brother and the decision was made to move to comfort care. He was discharged to inpatient hospice and died around 4pm on 1/18/21. This outcome does not appear to be vaccine-related, but death from COVID-19 infection is listed as a reportable event following COVID-19 vaccination.	No prior vaccinations for this event.
BILEVEL POSITIVE AIRWAY PRESSURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell

No prior vaccinations for this event.

count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was	No prior vaccinations for this event.

added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

BIOPSY BONE MARROW

COVID19 (COVID19

	(MODERNA)) (1201)
High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased; Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death	No prior vaccinations for this event.

BIOPSY SKIN ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Presented from clinic with 3-4 days of extensive rash. There were multiple areas of skin sloughing on bilateral upper extremities and abdominal wall.	No prior vaccinations for this event.

BLADDER CANCER STAGE IV

Patient died at home in hospice care from complications of stage 4 bladder cancer

COVID19 (COVID19 (MODERNA)) (1201)

No prior vaccinations for this event.

BLADDER CATHETERISATION

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this,

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

No prior vaccinations for this event.

her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

BLISTER	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient felt fine on Friday afternoon and evening after shot. Felt fine on Saturday until the afternoon when she started feeling fatigued and chilled. Decided to take a warm bath at about 6pm. Was found dead in bathtub at approximately 7pm with blisters on arms, legs, and face.	No prior vaccinations for this event.
BLISTER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient (now deceased) received 1st dose of Pfizer-BioNTech vaccine around December 21, 2020 and was noticed to be scratching, fatigued, and unresponsive by a family member on December 24, 2020. He received the second dose of the same vaccine around January 22, 2021. Pockmarks and bleeding scratch marks were noted by a family member on the patient's face prior to this second dose. On January 28, 2021 a family member was alerted that the patient was suffering from severe bullous pemphigoid- a skin condition that has never been experienced by the patient, has been reported to be related to COVID-19 viral infection, and to T-cell responses promoted by vaccines. A corticosteroid was given, but did not work. Blisters developed to the point hands had to be dressed.	No prior vaccinations for this event.

BLISTER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Presented from clinic with 3-4 days of extensive rash. There were multiple areas of skin sloughing on bilateral upper extremities and abdominal wall.	No prior vaccinations for this event.
BLOOD ALBUMIN	**COVID19 (COVID19 (MODERNA)) (1201)**
Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.	No prior vaccinations for this event.
BLOOD ALBUMIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was	No prior vaccinations for this event.

completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

BLOOD ALBUMIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.

BLOOD ALBUMIN DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.	No prior vaccinations for this event.

BLOOD ALBUMIN DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient has end stage renal disease and rapidly worsening dementia, family could no longer care for him at home, and he was admitted for 14-day quarantine prior to admission to inpatient hospice. Received vaccine on 1/12 without apparent adverse reactions. Patient started refusing oral intake on 1/16, and CMP on 1/17 showed hypernatremia 165 (new issue). His BUN 138 CREAT 6.93 K 5.2 were his baseline. He was found to be deceased on 1/18 at 11:18 pm.

No prior vaccinations for this event.

BLOOD ALBUMIN DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient presented to Vaccine clinic 1/12/21 to receive COVID vaccination. Patient denied any ill feeling, no fever, cleared for vaccination. Is chronically SOB due to COPD, but patient reported no different than usual. Presented to the ED the next day c/o SOB and weakness for the last week. Patients condition ultimately declined over the next few days and died 01/21/21 from pneumonia (not COVID). Patient did admit she lied about her symptoms on the day of vaccination to get the shot.

No prior vaccinations for this event.

BLOOD ALBUMIN DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient had gotten up to the bathroom and collapsed in the hallway after using the restroom. Patient was unresponsive upon EMS arrival with vomitus coming out of the mouth per the report when they rolled patient over onto his side the emesis was pouring out of his mouth. ER course: Examination. Epinephrine 1 mg IO x4 CBC, CMP, cardiac panel MDM: 1447 patient arrival, per EMS report patient had been sick and vomiting all morning. Bradycardia noted at arrival with rates in the 30s, CPR was initiated patient had received 3 rounds of epi prior to arrival. 1450 CPR continues via the Lucas device, 1 mg epinephrine given IV push 1451 CPR pause rhythm check. CPR resumes 1453 CPR paused for rhythm check. No central pulses, CPR resumed, glucose of 99 per fingerstick 1454 King tube removed. Oral airway placed

	BLOOD ALBUMIN DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities,		No prior vaccinations for

c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was

No prior vaccinations for this event.

made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency

artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5%

bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

BLOOD BILIRUBIN INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

BLOOD BILIRUBIN INCREASED

COVID19 (COVID19

	(PFIZER-BIONTECH)) (1200)
Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21	No prior vaccinations for this event.

Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.	No prior vaccinations for this event.
BLOOD BILIRUBIN NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central	No prior vaccinations for this event.

line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. BLOOD CALCIUM DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome

No prior vaccinations for this event.

presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he

started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

Temp of 100.1 and unproductive cough on 1/17; temp of 100.4 1/28; O2 desaturation 88% on RA 1/28; Diagnosed with Covid-19 on 1/18/2021 Patient passed away on 1/29/2021	No prior vaccinations for this event.
BLOOD CHLORIDE NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have	No prior vaccinations for this event.

intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

BLOOD CHOLESTEROL INCREASED		**COVID19 (COVID19 (MODERNA)) (1201)**
While at counseling appointment on February 17 patient had witnessed sudden cardiac arrest and was not able to be resuscitated. She was pronounced dead at 12:09. At the time of death her glucose was about 500.		No prior vaccinations for this event.
BLOOD CREATINE		**COVID19 (COVID19 (MODERNA)) (1201)**
Mentation has declined since hospital discharger for fall on 2/6/20201. Patient has also had significant poor oral intake. Brought in due to apneic episodes. Abdominal pain - diffuse tenderness (right sided) Elevated liver enzymes - likely secondary to dehydration Increased serum creatine kinase - likely due to dehydration		No prior vaccinations for this event.
BLOOD CREATINE ABNORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
"Resident complained of feeling ""hot"" at supper time. Had emesis an hour or so later. Became hypoxic and was transferred to the hospital emergency room. Her evaluation in the ED revealed continued presence of UTI, leukocytosis (19.8), and renal insufficiency (BUN 22 Cr. 1.3) BP 99/63; P 74; Temp 98.1; RR 16; and O2 sat of 95% with 2 LPNC (she is typically on RA). CXR reported changes most consistent with CHF with cardiomegaly and bilateral pulmonary vascular prominence. Bibasilar pleural effusions greater on the right than left with pulmonary edema. Large hiatal hernia and likely old chronic wedge defromities involving the mid thoracic vertebral body. She was admitted for IV antibiotics. She expired 2/6/2021"		No prior vaccinations for this event.
BLOOD CREATINE PHOSPHOKINASE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from nursing home staff report.	No prior vaccinations for this event.

COVID19 (COVID19

(PFIZER-BIONTECH))
(1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200

No prior vaccinations for this event.

IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

BLOOD CREATININE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.
BLOOD CREATININE INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
12/30/2020 07:02 AM Resident noted to have some redness in face and respiration were fast. Resident vital signs were abnormal except blood pressure. Temp at the time was 102.0 F taken temporal. Resident respirations were 22 labored at times. Pulse is 105 and pulse ox 94% on room air. Resident is made comfortable in bed. Notified triage of change in condition also made triage aware of resident receiving Covid vaccination yesterday morning. Resident appetite and fluid consumption has been poor for few days. 12/30/2020 07:32 AM Received order from agency to administer Acetaminophen 650mg suppos rectally due to resident not wanting to swallow anything including fluids, medications and food. This writer administered medication as NP ordered. Will monitor for effectiveness and adverse effects if any. 12/30/2020 08:41 AM Received new orders to obtain Flu swab, obtain CBC and BMP, and Chest Xray all to be obtained today. Notified family of resident having temperature and vital signs excluding b/p that was abnormal. Family was thankful for call and inierated to nurse that family does not want resident sent to hospital. Did educate family on benefits of Hospice services, but family persistant on continued daily care provided by nursing staff.	No prior vaccinations for this event.

Requests visits if decline continues. Family assured if resident continues to decline, facility will accomandate resident family to be able to be at bedside when time comes to do so. NP ordered IVF and IV Levaquin on 12/31/20. Family chose at that time to sign for Hospice services and not have resident provided with IVF or IV Antibiotics

BLOOD CREATININE INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient has end stage renal disease and rapidly worsening dementia, family could no longer care for him at home, and he was admitted for 14-day quarantine prior to admission to inpatient hospice. Received vaccine on 1/12 without apparent adverse reactions. Patient started refusing oral intake on 1/16, and CMP on 1/17 showed hypernatremia 165 (new issue). His BUN 138 CREAT 6.93 K 5.2 were his baseline. He was found to be deceased on 1/18 at 11:18 pm.

No prior vaccinations for this event.

BLOOD CREATININE INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Patient presented to Vaccine clinic 1/12/21 to receive COVID vaccination. Patient denied any ill feeling, no fever, cleared for vaccination. Is chronically SOB due to COPD, but patient reported no different than usual. Presented to the ED the next day c/o SOB and weakness for the last week. Patients condition ultimately declined over the next few days and died 01/21/21 from pneumonia (not COVID). Patient did admit she lied about her symptoms on the day of vaccination to get the shot.

No prior vaccinations for this event.

bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.

BLOOD CREATININE INCREASED		**COVID19 (COVID19 (MODERNA)) (1201)**
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.		No prior vaccinations for this event.
BLOOD CREATININE INCREASED		**COVID19 (COVID19 (MODERNA)) (1201)**
Died; Increased respirations (22 and labored at times); Pulse 105; 94% O2 on RA; Labored breathing at times; leukocytosis; elevated BUN; left lower lung congestion; elevated creatinine; Temperature of 102.0F; Redness on face; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced redness on face, increased respirations, labored breathing at times, temperature of 102F, pulse of 105, 94 percent O2, leukocytosis, elevated BUN, left lower lung congestion, elevated creatinine, and death. The patient's medical history, as provided by the reporter, included dementia and reduced mobility. No relevant concomitant medications were reported. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient began to experience redness on her face, increased respirations (reported as 22 and labored at times), pulse of 105, and 94 percent oxygen saturation on room air. The patient had a fever of 102 degrees Fahrenheit. Laboratory tests revealed a negative		No prior vaccinations for this event.

influenza swab, elevated white blood cell count of 14.1, elevated BUN at 113, and creatinine 2.7. Chest x-ray showed mild, left lower lung infiltrate. On 31 Dec 2020, the patient went under hospice care per her family request.. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2021, the cause of death was unknown.; Reporter's Comments: This case concerns a 92-year-old, female subject with medical history of dementia and reduced mobility, who experienced the serious unexpected events of death, respiratory rate increased, heart rate increased, oxygen saturation decreased, elevated BUN, elevated creatinine, left lung congestion and dyspnoea and the non-serious events of erythema and pyrexia. The events of respiratory rate increased, heart rate increased, oxygen saturation decreased, dyspnoea, erythema and pyrexia occurred 2 days after the first dose of the study medication administration, and the event of death occurred 4 days after the first dose of the study medication administration. Very limited information regarding the events is available at this time and no definite diagnosis or autopsy report have been provided. Additional information has been requested.; Reported Cause(s) of Death: Died

ER visit 1/25/21 patient walked into a prompt care and collapsed, witnessed and pulseless CPR with ROSC after 6-7mins, no shock no meds. Awake and speaking upon arrival to ER. 2 plus pitting edema ble ER diagnosis Anasarca, cardiac arrest, hypotension, elevated troponin I levels, Acute kidney injury and syncope. ER notes reveal a syncopal episode in the shower prior to collapse at prompt care. Central line placed and plan to ship to another facility, patient continued to decline despite dopamine and dobutamine expired in ER prior to transfer.	No prior vaccinations for this event.
BLOOD CREATININE INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower.	No prior vaccinations

caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.	for this event.
BLOOD CREATININE INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she	No prior vaccinations for this event.

developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

BLOOD CREATININE INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).

FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.

BLOOD CREATININE INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have

No prior vaccinations for this event.

decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

BLOOD CREATININE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.	No prior vaccinations for this event.
BLOOD CREATININE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an	No prior vaccinations for this event.

actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal	No prior vaccinations for this event.

labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent

aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145.

No prior vaccinations for this event.

At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient

No prior vaccinations for this event.

was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

While at counseling appointment on February 17 patient had witnessed sudden cardiac arrest and was not able to be resuscitated. She was pronounced dead at 12:09. At the time of death her glucose was about 500.	No prior vaccinations for this event.
BLOOD CREATININE NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.	No prior vaccinations for this event.
BLOOD CREATININE NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Temp of 100.1 and unproductive cough on 1/17; temp of 100.4 1/28; O2 desaturation 88% on RA 1/28; Diagnosed with Covid-19 on 1/18/2021 Patient passed away on 1/29/2021	No prior vaccinations for this event.
BLOOD CREATININE NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

1/18/2021- Tested positive for Covid-19. 1/20 Patient lethargic, unable to swallow. 1/24 Although 90% O2 sat on RA, it has decreased from her baseline ranging at high 90's. 1/27/2021 Patient passed.

No prior vaccinations for this event.

BLOOD CREATININE NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/7/21 Increased difficulty chewing, swallowing, evaluated by SLP and dietician. Diet texture down-graded x 2 with poor appetite and recent 6lb weight loss. 2/8/21-APRN updated regarding poor appetite and difficulty chewing as well as downgraded texture of diet. Also informed of increased s/s of discomfort and increased use of PRN Oxycodone for pain. 2/9/21- elevated temp 100.7. 2/9/21 Covid pcr test negative. 2/9/21-N.O.?s APRN BMP, Albumin and Pre-albumin Level in am. 2/11/21-elevated temp 100.4. Covid rapid test negative. 2/12/21- CBG recorded at 517 at 5:20 am. Resident also has an elevated temp of 100.9. Tylenol administered per order. Vital signs include resp 24, radial pulse 134, O2 sat 83%. Supplemental oxygen administered via nasal cannula. Head of bed elevated. DR. notified at time via telephone. Order given for sliding scale for CBG. Guardian updated regarding changes in residents condition, poor prognosis. Guardian requests Hospice eval and admit. Guardian requests comfort care no hospitalization, no IV's, no G-tubes, no labs etc, D/C of Palliative services. ARNP informed. 2/12/21 Acute Telehealth visit with APRN due to increased lethargy, elevated CBG?s despite poor appetite and insulin administration. Resident unresponsive to verbal and noxious stimuli at time of visit. N.O. Morphine sulfate 20mg/ml, give 2.5mg PO/SL Q4hr PRN pain/shortness of breath. 2/12/2021-Admitted to Hospice, Lethargic, diaphoretic, T 98.1 P 130's R 18 O2 high 80's to low 90's via O2 mask at 3L. 2/12/2021- Resident legs and arms noted to feel cool this afternoon, 02 sat was 97% with 02 on @ 3L with mask Noted resident with sob and increased pulse. Prn morphine 0.25ml sl. given with good effect. Resident was less restless and quiet in her bed. Checked on resident several times this shift for needs. Resident noted to not move in her bed @ 8:15pm and noted she was not breathing. Supervisor called and pronounced resident deceased.

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no

No prior vaccinations for this event.

peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

BLOOD CULTURE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from nursing home staff report.		No prior vaccinations for this event.
BLOOD CULTURE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown		No prior vaccinations for this event.

date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required

intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse	No prior vaccinations for this event.
BLOOD CULTURE NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient 101 years old, nursing home resident, received vaccine 1/11, on 1/13 found on floor without obvious trauma, unresponsive. Brought to ED and was bradycardic, hypotensive, hypothermic and refractory to aggressive medical management. No obvious cause of death found on exam or labs, cxr. Unknown if event could be related to vaccine or not. Medical Examiner accepted case although initially unknown that patient had recently received vaccine. ME updated with that information today as soon as discovered.	No prior vaccinations for this event.
BLOOD CULTURE NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.	No prior vaccinations for this event.
BLOOD CULTURE NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at	No prior vaccinations for this event.

time of this report."

	BLOOD CULTURE NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Symptoms of fever (Tmax 102.9), diarrhea, and altered mental status started ~ 24 hours after vaccination. No evidence of septicemia with negative blood cultures Minimal improvement over 3 days, transferred to tertiary care center for MRI brain after which LP was recommended. However family declined as intubation would have been required and was not consistent with patient's goals of care.		No prior vaccinations for this event.

	BLOOD CULTURE NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was		No prior vaccinations for this event.

continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

BLOOD CULTURE NEGATIVE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support.

No prior vaccinations for this event.

Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.

BLOOD CULTURE NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21. "In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they		No prior vaccinations for this event.

started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

BLOOD GASES	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.	No prior vaccinations for this event.

BLOOD GASES ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.	No prior vaccinations for this event.

BLOOD GASES ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found

No prior vaccinations for this event.

to have chronic R sided PE, no acute PE.

BLOOD GASES ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt develops left leg pain The day after vaccination in AM subsequently drove approximately 150 miles On his way back stopped at his brothers place for lunch. He then collapsed coning down the steps, EMS started CPR. took him to ER Resuscitated briefly but went into CardioPulm Arrest again and PEA Resucitaion for aprox 1 hour but was unsuccessful. Noted to have Left leg more swollen than Right by 3 to 4 CM presumed to have died from massive Pulmonary embolism and inferior wall myocardial ischemia	No prior vaccinations for this event.
BLOOD GLUCOSE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.

BLOOD GLUCOSE DECREASED		**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.		No prior vaccinations for this event.
BLOOD GLUCOSE DECREASED		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the		No prior vaccinations for this event.

hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

BLOOD GLUCOSE DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis	No prior vaccinations for this event.

involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. COVID19 (COVID19 (PFIZER-BIONTECH))

(1200)

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19)

BLOOD GLUCOSE NORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An 85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19 immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER		No prior vaccinations for this event.

UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything, nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30 (on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was

unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart stopped"

BLOOD LACTATE DEHYDROGENASE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more	No prior vaccinations for this event.

subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is

unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

BLOOD LACTIC ACID INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until	No prior vaccinations for this event.

family could be reached and decision was made to stop resuscitation.

BLOOD LACTIC ACID INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the

No prior vaccinations for this event.

decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending.

Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

Pt presented to ER with SOB on 01-29-2021. He was admitted to Healthcare with acute CHF exacerbation, elevated lactate, anemia and elevated d-dimer. Pt reports getting SOB getting up to go to the bathroom. Pt was intubated. He developed pulmonary edema. Pt expired on 02-02-2021 at 10:13 PM.		No prior vaccinations for this event.
	BLOOD LACTIC ACID INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Began having SOB and cough on 2/18/21, the day after his first vaccine. Had a routine physician appointment for diabetes on 2/15/21 with no documentation of these complaints. Presented to the hospital on 2/23, soon after required intubation. Admitted with severe pneumonia, diffuse colitis, and sepsis. Condition continued to worsen until patient passed away on 2/24/21 @ 1632.		No prior vaccinations for this event.
	BLOOD LACTIC ACID INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-		No prior vaccinations for this event.

2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

this event.

BLOOD LACTIC ACID INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider

No prior vaccinations for this event.

prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

BLOOD LACTIC ACID NORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.		No prior vaccinations for this event.
BLOOD LACTIC ACID NORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21		No prior vaccinations for this event.

based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

BLOOD LACTIC ACID NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis	No prior vaccinations for this event.

involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. BLOOD MAGNESIUM DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

COVID19 (COVID19 (MODERNA)) (1201)

Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.

No prior vaccinations for this event.

BLOOD MAGNESIUM INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.		No prior vaccinations for this event.
BLOOD MAGNESIUM INCREASED		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.		No prior vaccinations for this event.

appears to be uncomfortable Resident is able to verbalize his pain and where it is at, but is unable to explain the quality of the pain or give a number on the 0/10 pain scale.

BLOOD PHOSPHORUS INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.	No prior vaccinations for this event.
BLOOD POTASSIUM	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Narrative: Patient received COVID/Pfizer #1 2/10/21 in L deltoid. (Patient home bound). On 2/12/21 reported left flank rash. 2/13 rash spread to entire abdomen/chest and UEs. Continued with fluctuations in BP/HR, fluid retention. On 2/16 labs ordered and Medrol dose pack. seen in home on 2/19 by MD - RUE swelling; diffuse rash over entire body; additional labs ordered (order to home infusion company). Patient passed in AM of 2/20/21. Reported no urine output the prior evening. Additional labs not performed due to death of patient prior to lab company arrival.	No prior vaccinations for this event.
BLOOD POTASSIUM DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**

Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis, bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.

No prior vaccinations for this event.

BLOOD POTASSIUM DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Pt. presented to the ER with abd pain and septic shock. Pt. reported to feel ill shortly after receiving the vaccine.

No prior vaccinations for this event.

BLOOD POTASSIUM DECREASED

COVID19 (COVID19 (MODERNA)) (1201)

Abdominal pain, nausea and vomiting, shortness of breath, acidosis, hypoglycemia, death. Onset of abdominal pain was 30 minutes after administration of the vaccine followed by 20+ episodes of vomiting and dry heaving.

BLOOD POTASSIUM DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile

No prior vaccinations for this event.

stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

BLOOD POTASSIUM DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21	No prior vaccinations for this event.
BLOOD POTASSIUM INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient has end stage renal disease and rapidly worsening dementia, family could no longer care for him at home, and he was admitted for 14-day quarantine prior to admission to inpatient hospice. Received vaccine on 1/12 without apparent adverse reactions. Patient started refusing oral intake on 1/16, and CMP on 1/17 showed hypernatremia 165 (new issue). His BUN 138 CREAT 6.93 K 5.2 were his baseline. He was found to be deceased on 1/18 at 11:18 pm.	No prior vaccinations for this event.
BLOOD POTASSIUM INCREASED	**COVID19 (COVID19**

	(MODERNA)) (1201)
started having generalized weakness on 1/21/21, fatigued., nausea/vomiting. went to doctor on 1/25/21 with complaint of sore throat, cough, and felt congested. Went to ER on 1/25/21 with complaints of increased shortness of breath, worsening nausea and vomiting. started on oxygen for sats of 87%. admitted on 1/25/21. On 1/26/21 needed intubated, CXR showed worsening consolidative change right lung at right hilar level. Echocardiogram showed ejection fraction 35-40%, left atrium is moderately dilated.	No prior vaccinations for this event.
BLOOD POTASSIUM INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident c/o nausea evening of 1/29 (nausea common for her post dialysis), had a large emesis at approx 2220, 0030 (unusual for resident to vomit)- received Zofran per order. Skin cool and damp, Blood sugar 147 (checked due to h/o diabetes and poor intake). At approx 230am Blood pressured checked and noted to be 52/29. Resident transferred to ER, intubated and transferred to higher level of care where she passed away on 1/30 at 736pm. Resident's medical notes indicated likely shock, cardiogenic in nature, sepsis (source unknown) along with a multitude of other co-morbidities that resident has.	No prior vaccinations for this event.
BLOOD POTASSIUM INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Had acute respiratory failure, dysuria NSTEMI after Dose #1 Lot # 025L20A (Moderna) hospitalized same day 12/31/20 administered @ 1040 back to baseline. 2nd Dose on 1/27/21 0950 Lot as above. Unknown exact onset same day, ED by EMS @ 1745, respiratory distress, febrile 39.4 degrees C BP 150/105 RR 29	No prior vaccinations for this event.
BLOOD POTASSIUM INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt presents to ER with increased weakness, hypoxia, history of COPD, but not oxygen dependent.,	No prior vaccinations

hypotension. Acute Kidney failure noted in labs, not previously diagnosed , new hyperkalemia. BP 73/39, HR 67. dopamine initiated, and switched to Levophed. Oxygen Sat 86%, requiring 10 L O2. Transferred from this critical access hospital to another Hospital. Expires later 2-13-2021	for this event.	
BLOOD POTASSIUM INCREASED		**COVID19 (COVID19 (MODERNA)) (1201)**
ER visit 1/25/21 patient walked into a prompt care and collapsed, witnessed and pulseless CPR with ROSC after 6-7mins, no shock no meds. Awake and speaking upon arrival to ER. 2 plus pitting edema ble ER diagnosis Anasarca, cardiac arrest, hypotension, elevated troponin I levels, Acute kidney injury and syncope. ER notes reveal a syncopal episode in the shower prior to collapse at prompt care. Central line placed and plan to ship to another facility, patient continued to decline despite dopamine and dobutamine expired in ER prior to transfer.	No prior vaccinations for this event.	
BLOOD POTASSIUM INCREASED		**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.	No prior vaccinations for this event.	
BLOOD POTASSIUM INCREASED		**COVID19 (COVID19 (MODERNA)) (1201)**

Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).

No prior vaccinations for this event.

BLOOD POTASSIUM INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

BLOOD POTASSIUM NORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency

COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into

Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

BLOOD PRESSURE ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Patient received vaccine at Public Health Clinic. Patient ended up having a seizure 3 days later and ended up in the hospital. Found to have right lobe pneumonia and low depakote level. Patient noted to have multiple seizures at hospital, issues with stabilizing HR and BP, and passed away on 1/20/21.

No prior vaccinations for this event.

BLOOD PRESSURE ABNORMAL

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"The resident received is vaccine around 11:00 am and tolerated it without any difficulty or immediate adverse effects. He was at therapy from 12:36 pm until 1:22 pm when he stated he was too tired and could not do anymore. The therapist took him back to his room at that time and he got into bed himself but stated his legs felt heavy. At 1:50 pm the CNA answered his call light and found he had taken himself to the bathroom. She stated that when he went to get back into the bed it was ""abnormal"" how he was getting into it so she assisted him. At that time he quit breathing and she called a RN into the room immediately. He was found without a pulse, respirations, or blood pressure at 1:54 pm. He was a DNR."

BLOOD PRESSURE DECREASED

COVID19 (COVID19

	(MODERNA)) (1201)
This patient has been under hospice care for over 2 years at the nursing home. She has had a steady decline with gradual weight loss. She was totally dependent in her care needs. She received the vaccine on 1/2/2021 as part of the facility vaccination campaign. No adverse events noted initially. On 1/3/2021 at 6:06 pm, she was noted on vital sign checks (done every 4 hours for first 72 hours after vaccination) with BP 64/52 but otherwise asymptomatic. Subsequent BP improved. On 1/4/2021 at 4:45 am, pt found with respiratory rate of 30 with otherwise normal vital signs. Tachypnea persisted, so she received liquid morphine 2.5 mg without improvement. Supplemental oxygen was applied. Tachypnea persisted. She had poor oral intake after that point had persistent tachypnea and worsening hypoxemia despite clear lungs on exam. She remained under hospice care and comfort measures were continued. No blood testing or imaging tests were done. She required increasing amounts of oxygen, became hypotensive, and died peacefully on 1/8/2021 at 7:45 pm.	No prior vaccinations for this event.
BLOOD PRESSURE DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
2/2/21-1000-patient presented to the local emergency room with complains of fever, shortness of breath and decreased oxygen sats. temp 101.7, pulse 102, respirations 36, BP 141/92, oxygen 94%. Lung sounds crackles bilaterally with rhonchi on the left. patient worked up for sepsis, CXR shows mild atelectasis. blood pressure dropped, and continued to drop through treatment requiring levophed drop to be initiated. Patient POA determined that this would not be her sister's wishes and made the decision to make patient comfort care status. 2/3/21- patient lethargic throughout night. 0640-patient demise.	No prior vaccinations for this event.
BLOOD PRESSURE DECREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient had Covid-19 in October of 2020. He recovered. He received the vaccination on 12/30/2020 with no complaints. On 01-05-2021 it was noted to he was incontinent of urine and bilateral lower extremity edema. Lab work was completed showed acute kidney injury. He had decreased blood pressure and oxygen	No prior vaccinations for this event.

saturations on 01-06-2021 He was admitted to the hospital with rapid progression of symptoms and suggested multi-system failure. He had a long cardiac history. On 01-14-2021 he passed away with a diagnosis of Cardiomyopathic CHF, A.Fib contributory.

BLOOD PRESSURE MEASUREMENT	**COVID19 (COVID19 (MODERNA)) (1201)**
No pulse and no heart beat; couldn't wake him up; passed away; A spontaneous report was received from a daughter concerning a 84-year old, male patient who received Moderna's COVID-19 Vaccine (mRNA-1273) experienced no pulse or heartbeat, couldn't wake him up and passed away. The patient's medical history, as provided by the reporter, included high blood pressure and prostate cancer. No relevant concomitant medications were reported. On 19 Jan 2021, the patient had a blood pressure reading of 133/84 at a cardiology visit. On 13 Feb 2021, approximately 3 hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (batch number 031M20A) intramuscularly for prophylaxis of COVID-19 infection. On 13 Feb 2021 at 3:30 pm, the patient could not be woken up and was found with no pulse or heartbeat. Action taken with the drug in response to the events was not applicable. The outcome of the events, no pulse or heartbeat and couldn't wake him up, were not provided. The patient died on 13 Feb 2021. The cause of death was unknown.; Reporter's Comments: Very limited information regarding this event/s has been provided at this time. The patient's medical history of high blood pressure and prostate cancer remains the risk factors. The cause of death was unknown. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death	No prior vaccinations for this event.

Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking,	No prior vaccinations for this event.

neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA- 1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

No prior vaccinations for this event.
BLOOD SODIUM DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**	
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.		No prior vaccinations for this event.
BLOOD SODIUM DECREASED	**COVID19 (COVID19 (PFIZER-BIONTECH))**	

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

BLOOD SODIUM DECREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and ACLS guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and ACLS guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is

No prior vaccinations for this event.

a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.

BLOOD SODIUM INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient has end stage renal disease and rapidly worsening dementia, family could no longer care for him at home, and he was admitted for 14-day quarantine prior to admission to inpatient hospice. Received vaccine on 1/12 without apparent adverse reactions. Patient started refusing oral intake on 1/16, and CMP on 1/17 showed hypernatremia 165 (new issue). His BUN 138 CREAT 6.93 K 5.2 were his baseline. He was found to be deceased on 1/18 at 11:18 pm.	No prior vaccinations for this event.
BLOOD SODIUM INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21	No prior vaccinations for this event.

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status:

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have

No prior vaccinations for this event.

intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

BLOOD TEST	COVID19 (COVID19 (MODERNA)) (1201)
Patient received COVID-19 (Moderna) vaccine from the Health Department on afternoon of January 8, 2021 and went to sleep approximately 2300 that night. Was found unresponsive in bed the following morning and pronounced dead at 1336 on January 9, 2021	No prior vaccinations for this event.

BLOOD TEST	COVID19 (COVID19 (MODERNA)) (1201)
High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased; Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death	No prior vaccinations for this event.

BLOOD TEST	COVID19 (COVID19 (MODERNA)) (1201)
Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia	No prior vaccinations for this event.

BLOOD TEST

COVID19 (COVID19 (MODERNA)) (1201)

Case passed away on 2/28/21. During post vaccination monitoring, case did not have any adverse reactions. When writer spoke to him on 2/26/21 to schedule his second dose, he sounded well.

No prior vaccinations for this event.

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

My mom only had site soreness after her covid vaccine on 1/21 which resolved within a couple days. However, she died in the early morning hours of 1/25, she was fine the day before, no sign of injury. We found her collapsed on the ground and although we tried cpr she was already dead. She had gone to the hospital on 12/28 for shortness of breath, angina and symptomatic anemia, her ekg was unchanged and

No prior vaccinations for this event.

blood work normal except for anemia. The cardiologist did not think a cardiac cath was needed. Her shortness of breath improved with a blood transfusion and a dose of lasix (no heart failure).

BLOOD THYROID STIMULATING HORMONE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of	No prior vaccinations for this event.

45%.

BLOOD UREA INCREASED	**COVID19 (COVID19 (MODERNA)) (1201)**
Died; Increased respirations (22 and labored at times); Pulse 105; 94% O2 on RA; Labored breathing at times; leukocytosis; elevated BUN; left lower lung congestion; elevated creatinine; Temperature of 102.0F; Redness on face; A spontaneous report was received from a nurse concerning a 92-year-old, female patient	No prior vaccinations for this event.

who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced redness on face, increased respirations, labored breathing at times, temperature of 102F, pulse of 105, 94 percent O2, leukocytosis, elevated BUN, left lower lung congestion, elevated creatinine, and death. The patient's medical history, as provided by the reporter, included dementia and reduced mobility. No relevant concomitant medications were reported. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient began to experience redness on her face, increased respirations (reported as 22 and labored at times), pulse of 105, and 94 percent oxygen saturation on room air. The patient had a fever of 102 degrees Fahrenheit. Laboratory tests revealed a negative influenza swab, elevated white blood cell count of 14.1, elevated BUN at 113, and creatinine 2.7. Chest x-ray showed mild, left lower lung infiltrate. On 31 Dec 2020, the patient went under hospice care per her family request.. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2021, the cause of death was unknown.; Reporter's Comments: This case concerns a 92-year-old, female subject with medical history of dementia and reduced mobility, who experienced the serious unexpected events of death, respiratory rate increased, heart rate increased, oxygen saturation decreased, elevated BUN, elevated creatinine, left lung congestion and dyspnoea and the non-serious events of erythema and pyrexia. The events of respiratory rate increased, heart rate increased, oxygen saturation decreased, dyspnoea, erythema and pyrexia occurred 2 days after the first dose of the study medication administration, and the event of death occurred 4 days after the first dose of the study medication administration. Very limited information regarding the events is available at this time and no definite diagnosis or autopsy report have been provided. Additional information has been requested.; Reported Cause(s) of Death: Died

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay

No prior vaccinations for this event.

has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21

Lethargic, refusing medications and meals. 1/11/2021- Covid+, poor appetite.	No prior vaccinations for this event.
BLOOD UREA INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/14/2021-0545, blood noted left and right ear. 0715, vomited x 1. Covid Antigen positive. Acute MD visit-basilar crackles right and coughing. Increased confusion.	No prior vaccinations for this event.
BLOOD UREA INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP	No prior vaccinations for this event.

that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small

bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

BLOOD UREA INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart	No prior vaccinations for this event.

failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support.

Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT	No prior vaccinations for this event.

scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2

BLOOD UREA NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**	
Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.	No prior vaccinations for this event.	
BLOOD UREA NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**	
Patient awoke on 2/12/21 with altered mental status, confusion, respiratory distress, was taken to hospital by ambulance. Per ED notes from ED attending Pt presented with hypotension and respiratory distress. DNR status, patient given comfort measures and passed away in ED at 11:24 am on 2/12/21.	No prior vaccinations for this event.	
BLOOD UREA NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**	
Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.	No prior vaccinations for this event.	

BLOOD UREA NORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Temp of 100.1 and unproductive cough on 1/17; temp of 100.4 1/28; O2 desaturation 88% on RA 1/28; Diagnosed with Covid-19 on 1/18/2021 Patient passed away on 1/29/2021	No prior vaccinations for this event.
BLOOD URINE	**COVID19 (COVID19 (MODERNA)) (1201)**
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21	No prior vaccinations for this event.

based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

BLOOD URINE ABSENT

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with

No prior vaccinations for this event.

bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

BLUE TOE SYNDROME	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on	No prior vaccinations for this event.

17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

BODY TEMPERATURE

COVID19 (COVID19 (MODERNA)) (1201)

High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased; Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and

No prior vaccinations for this event.

mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

BODY TEMPERATURE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

approxmately 1:30 Pm the resident passed away; This is a spontaneous report from a Pfizer sponsored program. A non-contactable consumer reported that a female patient of an unspecified age (reported as 85 without unit) received the 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EL0140), intramuscular at left arm on 29Dec2020 11:29 at single dose for COVID-19 immunization. Medical history included dementia, aphasia, type 2 diabetes mellitus (DM), iron deficiency, asthenia, osteoporosis, polyneuropathy, anxiety, Major depressive disorder (MDD). Concomitant medication included gabapentin, memantine. The patient had allergies to codiene, phenobarbital, penicillin. The vaccine was administrated with no immediate adverse reaction at 11:29. Vaccine screening questions were completed and resident was not feeling sick and temperature was 98F. At approximately 13:30 on 29Dec2020, the resident passed away. It was not reported if an autopsy was performed. No follow-up attempts are possible. No further

No prior vaccinations for this event.

information is expected. ; Reported Cause(s) of Death: approxmately 1:30 Pm the resident passed away

BODY TEMPERATURE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches,	No prior vaccinations for this event.

diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on

10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

BODY TEMPERATURE	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
heart attacks; Collapse of lung; pulse was in the 130s/140s; passed away; nose and fingers turned gray and were cold to the touch; nose and fingers turned gray and were cold to the touch; his big toe had turned gray; his right foot was swollen; low grade fever; Shaking; extremely cold; This is a spontaneous report from a contactable consumer. An elderly male patient received the 2nd dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 18Feb2021, at single dose, for COVID-19 immunisation. Medical history included ongoing blood magnesium decreased (went to the hospital on 17Feb2021). Concomitant medications were not reported. Previously the patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), on 27Jan2021, for COVID-19 immunisation and experienced arm soreness. The patient experienced passed away (death, hospitalization, medically significant) on 23Feb2021, heart attacks (caused hospitalization, medically significant) on 20Feb2021 with	No prior vaccinations for this event.

outcome of unknown, collapse of lung (caused hospitalization) on 20Feb2021 with outcome of unknown, pulse was in the 130s/140s (caused hospitalization) on 19Feb2021 with outcome of unknown, low grade fever on 18Feb2021 with outcome of recovered on 23Feb2021, shaking on 18Feb2021 with outcome of unknown, extremely cold on 18Feb2021 with outcome of unknown, nose and fingers turned gray and were cold to the touch on 19Feb2021 with outcome of unknown, his big toe had turned gray on 19Feb2021 with outcome of unknown, his right foot was swollen on 19Feb2021 with outcome of unknown. The events his big toe had turned gray and his right foot was swollen required physician visit on 19Feb2021. They were reported as a result of the magnesium deficiency. On 19Feb2021 evening his fever increased and his nose and fingers turned gray and were cold to the touch. On 20Feb2021 he collapsed at home and was taken to the hospital by ambulance. He had several heart attacks prior to the collapse. They decided to put him in a medically induced coma and reduce his body temperature that evening and started dialysis on 21Feb2021. They returned his body to normal temperature on 23Feb2021, his pulse was in the 130s/140s. They were starting to reduce the sedatives on 23Feb2021. The patient passed away on 23Feb2021. It was not reported if an autopsy was performed. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: passed away

BODY TEMPERATURE ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Passed away; tired; nonresponsive; cold; difficulty breathing; swelling; sore arm; feeling weird and funny; A spontaneous report (United States) was received from a consumer concerning a 63 year old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and the patient experienced limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal and the patient passed away . Medical history included treatment for tuberculosis and dialysis. Concomitant medication included calcium acetate, Renvela, glipizide, omeprazole, aspirin, vitamin D, losartan, furosemide, rifampin, and Sensipar. On 14 Jan 2021, the patient received the first of their first planned doses of mRNA-1273 (lot number 030L20A) for prophylaxis of COVID-19 infection. On 13 Jan2021, the patient tested negative for COVID-19). On 16 Jan 2021, the patient experienced a sore arm, and feeling

No prior vaccinations for this event.

weird/funny. On 17Jan2021, the patient experienced difficulty breathing and swelling. On 18 Jan 2021, the patient declined dialysis, was tired and wanted to lay down. At 8 am, the patient was found nonresponsive and cold and is believed to have passed away around 4 am. The coroner tested the deceased for COVID-19 and the test was positive. No autopsy was reported. No death certificate was issued at the time of the report but the reporter believes it will list cause of death as COVID complications. Action taken with the mRNA-1273 was not applicable. The outcome of the events of limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal, was fatal. On 18 Jan 2021, the patient was died. Cause of death was COVID-19. Autopsy details were not provided.; Reporter's Comments: The events developed on four days after first dose of mRNA-1372. Dyspnea, unresponsive to stimuli, and death were consistent with infection in pandemic set up confounded by age of patient and refusal of dialysis Cause of death was reported as COVID-19. Autopsy details were not provided. Based on reporter's causality the events are assessed as unlikely related to mRNA-1273.; Reported Cause(s) of Death: COVID-19

Resident reviewed for incident. Resident received the second dose of the Moderna Covid-19 vaccine lot# 016M20A Exp 5/2/2021 on 2/5/2021 from clinic through pharmacy. Resident had her temp/O2 taken on AM shift and was 98.6/93%, beginning PM shift 98.4/95%. A few hours later noted that resident to have chills and was shaking RN assessment completed and vitals taken resident noted to have temp of 102.2, oxygen 95%, pulse 110. Resident alert and oriented at that time and talking to staff. Reported findings to APNP with order to send to ER. 911 called, residents brother updated. Upon EMT arrival RN went down to residents room with EMT and resident had an emesis as resident was getting cleaned up resident went unresponsive. Pulse noted to still be present at that time, resident did briefly respond to sternal rub and then went unresponsive again. Resident full code and EMT transferred to gurney and said that if they lost a pulse in route that they would transfer to hospital B instead of hospital A being the closest facility. RN called brother and gave update. Facility notified from Hospital that resident had passed away.

BODY TEMPERATURE INCREASED

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE,

on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

BONE FRAGMENTATION

COVID19 (COVID19 (MODERNA)) (1201)

On 1/23/21 the patient had a single-car accident, slid off icy road into snowbank. She was seen in our ER, diagnosed w/ trauma and L4 compression fracture. She was transported to Hospital for further trauma workup. We believe she was treated and released. On 1/31/21 the patient had a headache but did not seek medical attention. In the morning of 2/1 she became unresponsive and was pronounced dead on the scene when EMS arrived. Autopsy showed a left temporal subdural hematoma.

(1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

BRAIN HYPOXIA

COVID19 (COVID19 (MODERNA)) (1201)

Passed away; Found unconscious; Coma; Lack of oxygen to the brain; A spontaneous report was received from a consumer, concerning his mother, a 71-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and passed away, prior to death, patient experienced lack of oxygen to the brain and was found unconscious and went to coma. The patient's medical history reported included seizures. Concomitant medications included phenobarbital, lamotrigine and levetiracetam. On 27 Jan 2021, approximately six days prior to the onset of events, the patient received their first of two planned doses of mRNA-1273 (lot number: 030L20A) intramuscularly for prophylaxis of COVID-19 infection. On 01 Feb 2021 at 4 am, the patient was found to be unconscious on the couch, hence she was rushed to the hospital with lack of oxygen to the brain. Later, she went into a coma, hence she was in hospital for 30 hours and then was transferred to a different hospital for a second opinion on 06-Feb-2021, where she was passed away at 02:20 PM. Treatment information was not provided Action taken with mRNA-1273 in response to the events were not applicable. The outcome of events, lack of oxygen to the brain, found unconscious and coma were considered unknown. The outcome of event passed away was fatal as she died on 06 Feb 2021 at 2:20 pm. The cause of death was not provided. Plans for an autopsy were unknown.; Reporter's Comments: This is a case of 71-year-old female subject with a history of seizures who died 6 days after receiving first dose of vaccine. Very limited information has been provided at this time. Further information has been

Fall 2/4 hospital admission 2/7/21 with death on 2/8/2021. Patient continued to decline on Bipap he was a DNR/DNI and family decided on comfort measures and he expired 2/8/2021.

No prior vaccinations for this event.

BRAIN NATRIURETIC PEPTIDE INCREASED

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

61 yo F with history of bilateral lung transplant 6/23/17 presented to ED on 2/4/21 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine (Pfizer) on 1/28/21. Upon arrival to triage she was obviously dyspneic with significantly low oxygen saturations. O2 sats on arrival were 65%, improved to mid 90's with O2 6 liters per NC. Admitting diagnosis: hypoxic respiratory failure post COVID vaccine. Lab work shows an elevation of the BUN and

No prior vaccinations for this event.

creatinine at 31 and 1.71 which is slightly higher than her usual baseline levels. BNP is elevated at 2 448 with a mildly elevated troponin. Procalcitonin is also elevated. Patient's white blood cell count is 11.07. Full viral panel including COVID-19 is not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, Thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 2/8/2021 and then VV ECMO cannulation on 2/13/2021. EGD done 2/14/2021 as unable to pass the TEE probe during cannulation prior day (unable to complete due to abnormal anatomy). Acute pupil exam change in the early am hours of 2/15/2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. GOL engaged and patient not an organ donation candidate. Therefore discussion with sister at bedside resulted in decision for cessation of life support. Patient expired shortly after support withdrawn and pronounced dead on 2/15/2021 at 11:11 AM.

BRAIN NATRIURETIC PEPTIDE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Began having SOB and cough on 2/18/21, the day after his first vaccine. Had a routine physician appointment for diabetes on 2/15/21 with no documentation of these complaints. Presented to the hospital on 2/23, soon after required intubation. Admitted with severe pneumonia, diffuse colitis, and sepsis. Condition continued to worsen until patient passed away on 2/24/21 @ 1632.	No prior vaccinations for this event.

Authorization (EUA)

	BRAIN OEDEMA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."		No prior vaccinations for this event.

BREATH SOUNDS ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

"The patient came to the Emergency Room at approx 3:30 am on 02/03/2021 with pain in right arm (same arm the COVID vaccine had been administered in approx 12 hours earlier) and feeling generally unwell. Patient was concerned about possibility of gout flare or that something was wrong with her arm. Elevated blood pressure was noted; this was attributed to anxiety. She was evaluated, given 500 mg Tylenol, and discharged since the pain was decreasing and blood pressure was stabilized. Patient instructed to follow-up with physician. The next day, on 02/04/2021, the patient arrived at the Emergency Room by ambulance; cardiac arrest was the chief complaint. The patient's daughter stated the patient had been ""feeling generally poor and then suddenly collapsed."" Daughter described ""gurgling respirations"" and being unresponsive. 911 was called, police arrived within 5 minutes and initiated CPR. Epinephrine, atropine, lidocaine and bicarb administered after arrival to Emergency Room. Shockable rhythm never demonstrated. Patient never recovered spontaneous respiration or movement. The death was called at 23:04. Coronary artery disease with cardiac arrest is the cause from the ER records; the coroner is putting COVID-19 vaccination in Part 1 of the death certificate."

After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of	No prior vaccinations for this event.

breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

BREATH SOUNDS ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
He started vomiting 2 days later. we suspect he was having stool issues as well. he vomited blood at some point over the weekend. there was black vomit right before he passed. from 2am-6am he was wheezing and rattling and then he passed at approximately 6am 3/1/2021 at home. EMS did come and try to revive him and were unsuccessful.	No prior vaccinations for this event.
BREATH SOUNDS ABSENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was was brought to the ED from facility which he received the vaccine via ambulance with BiPAP, hypoxia, and one dose of Epi of 0.3 mg. He then required intubation, and had struggled with hypoxia, even on increasing PEEP. CODE BLUE called in the ED for PEA. He was medicated for such (please see the code run sheet for details), and he came in and out of the code 5 times. After 95 minutes, with the wife at the bedside, and family conference by phone, the code was called, and he was pronounced at 18:20. He received in total 8 me of Epi, 3 shots of Atropine, 3 amps bicarb. He got lasix 40 mg, lovenox 60 mg subcutaneous once. He had a CVC into the right internal jugular, and levophed was started, then Epinephrine drip was started. Prior to the code he got steroids (solumedrol 125 mg, then later decadron 6	No prior vaccinations for this event.

mg iv), benadryl iv, antibiotics (ceftraixone / zithromax), and lasix 40 mg. All this time while in the ED, the Rt was at the bedside, and lots of secretions from the lungs were aspirated, bloody color. á Code was the result of PEA secondary to hypoxia (

BRONCHIAL SECRETION RETENTION	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Staff member checked on her at 3am and patient stated that she felt like she couldn't breathe. 911 was called and taken to the hospital. While in the ambulance, patient coded. Patient was given CPR and ""brought back"". Once at the hospital, patient was placed on a ventilator and efforts were made to contact the guardian for end of life decisions. Two EEGs were given to determine that patient had no brain activity. Guardian, made the decision to end all life saving measures. Patient was taken off the ventilator on 1/9/2021 and passed away at 1:30am on 1/10/2021. The initial indication from the ICU doctor was the patient had a mucus plug that she couldn't clear."	No prior vaccinations for this event.

BRONCHOSCOPY ABNORMAL	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and	No prior vaccinations for this event.

tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"		
BULBAR PALSY		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
[COVID-19 Vaccine] treatment under Emergency Use Authorization(EUA): He presented 10 days after first COVID-19 Vaccine with Progressive neurological deficits with bulbar manifestations - dysarthria, dysphagia and bilateral arm weakness and incoordiantion, worse on right. MRI brain was negative for acute stroke and MRI cervical, showed degenerative changes. Transferred from community hospital to tertiary center where the diagnosis was made of AIDP. He was intubated at that time in Neuro ICU. Given Steroids and IVIG but no improvement and was either will need to have Trach and PEG vs CMP and family honored the patient's wishes and made him CMO. signs of severe demyelination and AIDP was diagnosed. "shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-		No prior vaccinations for this event.

dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in

setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the

No prior vaccinations for this event.

emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

CARDIAC ARREST **COVID19 (COVID19 (MODERNA)) (1201)**

My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just

No prior vaccinations for this event.

experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.

CARDIAC ARREST	COVID19 (COVID19 (MODERNA)) (1201)
Narrative: Patient experienced cardiac arrest with PEA and a witnessed collapse upon arrival to the emergency department on 1/24/21. Patient received his first dose of the COVID vaccine on 01/15/2021and felt poorly thereafter. He was describing shortness of breath to his wife and requiring 5L of O2 at home to maintain saturations in 80s, while he usually was on 3L to maintain saturations in the mid 90s. He had been oriented but more fatigued than normal and described bilateral shoulder pain (which was not new for him) as well as indigestion. Took Tylenol with some relief. He had decreased PO intake and less appetite. The patient's wife encouraged him to come to the hospital daily for a week prior to admission, but the patient did not want to because he felt his side effects were secondary to the vaccine. Symptoms:RespDepression, Palpitations, Syncope & cardiac arrest Treatment: EPINEPHRINE 1 MG ONCE 3 rounds given ,CALCIUM CHLORIDE 1000 MG ONCE	No prior vaccinations for this event.

CARDIAC ARREST	COVID19 (COVID19 (MODERNA)) (1201)
Cardiac arrest; Pain on her upper right chest; Lot of pain in lower abdomen; Pain underneath arm; Thought it was muscle aches; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed upper right chest pain and underneath the arm, severe abdominal pain, muscle aches and cardiac arrest. The patient's medical history was not provided Concomitant product use was not provided by the reporter. On 14 Jan 2021, approximately five days prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the arm for prophylaxis of COVID-19 infection. On 19 Jan 2021, the patient developed upper right chest pain and pain underneath the arm. They thought it was muscle aches. Sometime later, the patient developed a lot of pain in the lower abdomen. The called emergency services and an ambulance arrived but the patient then suffered cardiac arrest. Treatment for the event included tramadol. Action taken with mRNA-1273 in response to the events was not applicable due to the patient was died. The patient died	No prior vaccinations for this event.

on 19 Jan 2021. The cause of death was reported as cardiac arrest. Autopsy were not provided.; Reporter's Comments: Company Comment: This case concerns a 92-year-old female patient who experienced unexpected serious events of cardiac arrest, upper right chest pain and underneath the arm, severe abdominal pain, muscle aches. The event occurred 5 days after the administration of the first dose of the vaccine mRNA-1273 vaccine (Lot #: unknown, expiration date-unknown). Although a temporal association exist between the events and the administration of the vaccine, in the absence of critical details such as the patient's medical history, any diagnostic test or autopsy result, adequate evaluation and assessment cannot be established. Main field defaults to æpossibly related' for all events.; Reported Cause(s) of Death: Cardiac arrest

Patient had the first Moderna Covid vaccine on Thursday 1/21/2021. She had a bit of sore arm on that day and the day after. On Saturday 1/23/2021, she had a fever of 100.5 F (11AM), nausea, light headache and chills. The temperature went down after she took ibuprofen. Patient's husband enrolled her to V-Safe to report all the adverse effects she experienced. On Sunday 1/24/2021, her temperature was 98.3F. She still had nausea and no appetite. She and her husband watched a football game in their bedroom upstairs. Husband noticed that his wife was pacing around the room many times. At 7Pm, Husband went downstairs for dinner but she refused to come down to eat. He went upstairs around 8pm, TV was still on. He turned off TV and went down stairs again thinking his wife felt as sleep while watching TV. He went back upstairs for bed around 10:30 PM. Husband said his wife had a deviated septum so she would snore very loudly when asleep. He didn?t hear her snoring so he went to check on her and found her not responsive. Husband called emergency services. Paramedic came at 10:45 and said patient was passed. Husband sent many texts to V-safe after that to report the incident. No response was received from V-safe. Patient?s doctor told her husband that she died due to cardiac arrest.

No prior vaccinations for this event.

"Patient called EMS approximately 1pm on 2/15 with complaints of generalized weakness. Upon arrival EMS found her to be diaphoretic and she had a witnessed syncopal episode with question of v-fib and seizures. She became unresponsive and had no pulse. CPR was begun and she was transported to ED. She remained asystole throughout. CPR was initially continued in the ED for approximately 30 minutes and then stopped	No prior vaccinations for this event.

with Time of Death noted at 13:27. ED notes noted ""suspect given history that patient experienced massive MI, PE or ruptured AAA"". Death certificate notes indicate ""signficant conditions contributing to death after cardiac arrest; ASCVD""."

	CARDIAC ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
Per EMS/Hospital report patient had difficulty breathing and cardiac arrest with prolonged CPR (greater than 45 mins in the ER) who was resuscitated. Family subsequently arrived including son and daughter and all family members were in the ER room are in agreement that patient would not want further aggressive cares given her extremely poor prognosis in light of chronic debilitation with numerous medical issues and now a very long period of CPR. Hospital Course After updating family they stated patient would not want further aggressive cares given her grim prognosis and chronic severe and debilitating medical issues. She continued to have myoclonic jerking. She was extubated to comfort cares in the ER and did not pass immediately therefore brought to a room. She received comfort cares and passed away at 0450 with family present.		No prior vaccinations for this event.
	CARDIAC ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient fell the day after receiving the Moderna COVID-19 vaccine. She broke her hip in this fall. During surgery to correct the broken hip, she went in to sudden and unexpected cardiac arrest. The anesthetist did not notice any ST changes or A fib; dysrhythmia was very unexpected. The patient had a DNR. She died at 13:00 on 02/07/2021. Causes of death are listed as 1. Cardiac Arrest 2. Recent hip fracture with hip placement 3. History of Breast Cancer 4. Hypothyroid and 5. Dementia		No prior vaccinations for this event.
	CARDIAC ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
"The patient came to the Emergency Room at approx 3:30 am on 02/03/2021 with pain in right arm (same		No prior vaccinations

arm the COVID vaccine had been administered in approx 12 hours earlier) and feeling generally unwell. Patient was concerned about possibility of gout flare or that something was wrong with her arm. Elevated blood pressure was noted; this was attributed to anxiety. She was evaluated, given 500 mg Tylenol, and discharged since the pain was decreasing and blood pressure was stabilized. Patient instructed to follow-up with physician. The next day, on 02/04/2021, the patient arrived at the Emergency Room by ambulance; cardiac arrest was the chief complaint. The patient's daughter stated the patient had been ""feeling generally poor and then suddenly collapsed."" Daughter described ""gurgling respirations"" and being unresponsive. 911 was called, police arrived within 5 minutes and initiated CPR. Epinephrine, atropine, lidocaine and bicarb administered after arrival to Emergency Room. Shockable rhythm never demonstrated. Patient never recovered spontaneous respiration or movement. The death was called at 23:04. Coronary artery disease with cardiac arrest is the cause from the ER records; the coroner is putting COVID-19 vaccination in Part 1 of the death certificate."	for this event.	
CARDIAC ARREST		**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.	No prior vaccinations for this event.	
CARDIAC ARREST		**COVID19 (COVID19 (MODERNA)) (1201)**

Patient collapsed and could not be revived. There was no prior warning. She was otherwise in good condition for her age. The death was listed as probable cardiac arrest but no autopsy was performed. Since it occurred so close to the vaccine shot I thought someone may want to know.	No prior vaccinations for this event.	
CARDIAC ARREST		**COVID19 (COVID19 (MODERNA)) (1201)**
unknown if related to vaccine. patient received 2nd vaccine at 0830, observed 15 minutes, discharged, arrested at 0915 upon entering her home. vaccine was administered by DOH at their community location. patient was pronounced lifeless in the ED.	No prior vaccinations for this event.	
CARDIAC ARREST		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient was found unconscious without a pulse. Patient remained in asystole without pulse or respirations despite CPR.	No prior vaccinations for this event.

CARDIAC ARREST **COVID19 (COVID19 (MODERNA)) (1201)**

On January 1, 2021, patient was admitted to Medical Center with COVID. Tested positive on January 2, 2021. Spent 10 days in hospital. Once recovered from pneumonia and fever gone, on January 10, 2021, she was transferred to Rehabilitation Center for continued treatment. She spent 16 days there. She developed UTI and CDIF infections and was on/off oxygen. She started physical therapy. She was scheduled to be released to go home on January 27, 2021. On January 26, 2021, the day before going home, Rehabilitation Center gave her the Moderna vaccine. On January 27, the day she went home, she started feeling very weak and couldn't walk. My dad tried lifting her and they both fell to the ground. My dad called 911 and she was taken to Medical Center, with high fever and possible stroke symptoms (which later was negative). Two days later, she had difficulty breathing and was put on a ventilator. She was on a ventilator for about three days. They took it off and she slowly started recovering. The doctors did all kinds of tests (blood clot in lung, heart, etc.) and all was negative. The only thing they could trace it to was an adverse reaction to the vaccine. After spending 11 days at hospital and treating her for various infections, her heart stopped and she passed away suddenly.	No prior vaccinations for this event.

My grandpa got his second covid vaccine on Thursday. Saturday he complained of stiff neck. Sunday he had low grade fever, nausea and vomiting, chills, and mild headache. He was feeling bad enough to call squad at 3 pm. The paramedics did evaluation and thought he was just experiencing normal side effects from vaccine and felt no need to transport to hospital so my grandpa decided to stay home and just rest. At 2 am that same night he went into cardiac arrest and was not able to be brought back

CARDIAC ARREST

COVID19 (COVID19 (MODERNA)) (1201)

No pulse and no heart beat; couldn't wake him up; passed away; A spontaneous report was received from a daughter concerning a 84-year old, male patient who received Moderna's COVID-19 Vaccine (mRNA-1273) experienced no pulse or heartbeat, couldn't wake him up and passed away. The patient's medical history, as provided by the reporter, included high blood pressure and prostate cancer. No relevant concomitant medications were reported. On 19 Jan 2021, the patient had a blood pressure reading of 133/84 at a cardiology visit. On 13 Feb 2021, approximately 3 hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (batch number 031M20A) intramuscularly for prophylaxis of COVID-19 infection. On 13 Feb 2021 at 3:30 pm, the patient could not be woken up and was found with no pulse or heartbeat. Action taken with the drug in response to the events was not applicable. The outcome of the events, no pulse or heartbeat and couldn't wake him up, were not provided. The patient died on 13 Feb 2021. The cause of death was unknown.; Reporter's Comments: Very limited information regarding this event/s has been provided at this time. The patient's medical history of high blood pressure and prostate cancer remains the risk factors. The cause of death was unknown. Further information has been requested.;

This is a spontaneous report from a contactable other healthcare professional (HCP). A 66-year-old female patient (pregnant at the time of vaccination: no) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1284) via intramuscular at left arm on 11Jan2021 12:15 PM at single dose for COVID-19 immunization. Medical history included diastolic CHF, spinal stenosis, morbid obesity, epilepsy, pulmonary hypertension and COVID-19 (Prior to vaccination, the patient was diagnosed with COVID-19). The patient received medication within 2 weeks of vaccination included amiodarone, melatonin, venlafaxine hydrochloride (EFFEXOR), ibuprofen, aripiprazole (ABILIFY), lisinopril, cranberry capsules, diltiazem, paracetamol (TYLENOL), famotidine, furosemide (LASIX [FUROSEMIDE]), ipratropium bromide, salbutamol sulfate (IPRATROPIUM/ALBUTEROL), buspirone, senna alexandrina leaf (SENNA [SENNA ALEXANDRINA LEAF]), polyethylene glycol 3350 and morphine. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient used took Penicillin, propranolol, quetiapine, topiramate, Lamictal and had allergy to them. Patient used took the first dose of BNT162B2 (lot number: EJ1685) via intramuscular at right arm on 21Dec2020 12:00 PM at single dose for COVID-19 immunization. Since the vaccination, the patient been tested for COVID-19 (Sars-cov-2 PCR) via nasal swab on 06Jan2021, covid test result was negative. Patient was found pulseless and breathless 20 minutes following the vaccine administration (11Jan2021 12:30 AM). MD found no signs of anaphylaxis. Patient died on 11Jan2021 12:30 AM because of cardiac arrest. No treatment received for the events. Outcome of pulseless and breathless was unknown. the autopsy was performed, and autopsy remarks was unknown. Autopsy-determined cause of death was unknown. It was reported as non-serious, not results in death, Life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect.; Sender's Comments: Based on the available information this patient had multiple underlying medical conditions including morbid obesity, diastolic CHF, epilepsy, pulmonary hypertension and COVID-19 diagnosed prior to vaccination. All these conditions more likely contributed to patients cardiac arrest resulting in death. However, based on a close temporal association (""Patient was found pulseless and breathless 20 minutes following the second dose of BNT162B2 vaccine administration, contributory role of BNT162B2 vaccine to the onset of reported events cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part for this event.

	CARDIAC ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.	No prior vaccinations for this event.

CARDIAC ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An 85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19 immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything, nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30	No prior vaccinations for this event.

(on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart stopped"

CARDIAC ARREST

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
Cardiac arrest; Patient transported by EMS to hospital 11:00pm on 01/29/2021. Patient received vaccine on 01/25/2021. Patient expired 01/30/2021 within the hour into the new day after midnight on 01/30/2021. Patient was feeling well prior to and any chronic health conditions were well controlled. Sudden cardiac arrest 4 days after receiving the vaccine. Details given by patients husband/POA.	No prior vaccinations for this event.
CARDIAC ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient noted to have irregular breathing in bed and unable to arouse. Provided life saving measures in the field x 30 minutes and transferred to hospital. Noted to have heart arrhythmia which suspected to cause cardiac arrest.	No prior vaccinations for this event.
CARDIAC ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient expired. Per Emergency MD note: ""This is a 72-year-old male with what sounds like diabetes, atrial fibrillation, and hypertension who presents via EMS in cardiac arrest. It sounds like he received his Covid vaccine last week. Initially he had some mild effects from it. However over the last day or so he has felt very unwell. He apparently called his wife today and told her that he was not feeling well and so she returned home. Shortly thereafter he attempted to get up from his chair. He then collapsed and fell forward onto his face. Sounds like his wife had some difficulty rolling him over to perform CPR. When EMS arrived they found him in PEA. He received a total of 5 rounds of epinephrine. At some point they did have return of spontaneous circulation. However just prior to arriving in the emergency department they lost pulses again. The patient was intubated with an 8 oh endotracheal tube prior to arrival."""	No prior vaccinations for this event.

	CARDIAC ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."		No prior vaccinations for this event.

	CARDIAC ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On 2/5/2021 resident noted to be azotemic. Creatinine up to 3.8 and BUN in 80's. He was started on NS hydration. On 2/7/2021 he was noted without VS, per MD notes, possible VF arrest, renal failure;		No prior vaccinations for this event.

death unclear exact cause.

CARDIAC ARREST	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical	No prior vaccinations for this event.

consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he	No prior vaccinations for this event.

passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending.

Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

	CARDIAC ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
For the two days prior to presentation the patient had been complaining of chest pain, his breathing seemed to be labored Monday. He and the family thought the pain was due to shingles as he carried this diagnosis from a month ago. Patient had also received the COVID vaccine 2 days prior to presentation and assumed he was feeling unwell due to the vaccine. Family wanted to take him to the hospital yesterday and earlier today but he refused. She left him in his home earlier this afternoon prior to presentation and returned to check on him finding him unresponsive and apneic at which time EMS was activated. #cardiac arrest -- suspect primary cardiac given collateral from family at home, consider hypoxemia which was corrected with advanced airway and 100% FiO2, patient clinically euvolemic and with soft brown stool in diaper not suggestive of GI hemorrhage, attempt to address acidosis with CPR and bicarbonate, not hypoglycemia, on bedside ultrasound FAST neg and no pericardial effusion suggestive of tamponade and +lung sliding bil not spontaneous pneumothorax Assessment/Diagnosis: -cardiac arrest, cause unspecified		No prior vaccinations for this event.

My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done

CARDIAC ARREST	COVID19 (COVID19 (UNKNOWN)) (1202)
Patient was admitted to hospital from home in cardiac arrest. Hx of hypertension, hyperlipidemia, type 2 diabetes (not on insulin) and bilateral carotid artery stenosis. The patient was reportedly at his baseline health on 2/2/21. He received the 2nd dose of COVID vaccine around 1000AM on 2/2/21. Reportedly started running fever of 100.1 and chills the afternoon of 2/2/21. Around 7:00PM he started having dry cough and was complaining of breathing difficulties. He subsequently vomited multiple times (was eating pizza and aspirated) then lost consciousness. His wife called 911, did CPR and EMS reported he in PEA at scene and was intubated. Transported to hospital. SARS CoV-2 and influenza negative.	No prior vaccinations for this event.

CARDIAC ASSISTANCE DEVICE USER	COVID19 (COVID19 (MODERNA)) (1201)
Short version The patient has long-standing health issues. The patient received the first dose of Moderna COVID-19 vaccine on 1/16/2021 (unknown location). The patient suffered an event in his home on 1/24/2021. CPR and treatment was begun and he was transported to the ED. He was pronounced dead in the ED at 0846. Long version 70-year-old male with past medical history of CAD with pacemaker, A. fib, COPD, hypertension/hyperlipidemia presenting in cardiac arrest. 911 call at 0724. Per EMS, patient was witnessed by family to have seizure-like activity and then collapsed and became unresponsive. Patient was noted by family to be pulseless and CPR was started right away. Patient received two doses of epi by police were on scene first (AED defibrillation x2) and six doses of epi (plus 6 more AED shocks) by EMS when they arrived. Patient had CPR performed for 45 minutes prior to arriving at the hospital. On route, patient had episodes of paced rhythm and V. fib. Patient received one amp of bicarb and one amp of calcium en route. Patient also received 300 mg of amiodarone en route. Arrived in ED at 0810 Patient received ongoing compressions, shocks and additional medications (epinephrine x6, lidocaine IV, sodium bicarbonate) until time of death called at 0846 in	No prior vaccinations for this event.

the ED.

CARDIAC DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
On 3/2/2021, clinic was notified by patient's family that patient had deceased on 2/28/2021 from a heart attack. Unsure of any relation to the Moderna vaccine but reporting for due diligence.	No prior vaccinations for this event.
CARDIAC DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
"1-2-2021 10:30 PM Complained Right arm/back hurt - took Tylenol 1-3-2021 Complained Right arm hurt, dizzy 1-4-2021 Felt better - did laundry, daughter found her deceased at 3:30 pm. Dr. at hospital said it was ""cardiac event"" according to death certificate."	No prior vaccinations for this event.
CARDIAC DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccination at 14:20 2/26/21. Was observed until discharged at 15:15. Discharged per wheel chair to lobby in alert/stable condition, to wait on bus to take him home. At 18:00 his neighbor heard him fall, could not get patient to answer phone, found him unresponsive. Neighbor called 9-1-1, ambulance personnel could not revive patient. Coroner's office ruled his death as Natural Causes due to Hypertension, Cardiac disease, Diabetes, ESRD. There were no indication of anaphylactic reaction noted when I questioned the coroner's office. The Coroner's office/EMS were aware the patient had received the Moderna COVID 19 vaccination that day.	No prior vaccinations for this event.
CARDIAC DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**

Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse		No prior vaccinations for this event.

patient experienced chills for approximately 6 hours, followed by severe (visible) chest spasms, and then cardiac arrest. 911 was called upon witnessing chest spasms, but cardiac arrest/death occurred before patient could be transported to the hospital.	this event.	
CARDIAC DISORDER		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
blood clot; death cause: Heart Problems; tired; nauseous; This is a spontaneous report from a contactable consumer. An 81-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot number EL3248), via an unspecified route of administration at single dose in the left arm on 19Jan2021 14:00 for covid-19 immunisation. Medical history included heart problems, pacemaker. Concomitant medication included heparin. The patient experienced death cause: heart problems on 20Jan2021, blood clot on an unspecified date with outcome of unknown that required hospitalization, tired on 19Jan2021 with outcome of unknown, nauseous on 19Jan2021 with outcome of unknown. The patient was hospitalized for blood clot from 16Jan2021 to 18Jan2021. The patient died on 20Jan2021. An autopsy was not performed. The events were described as follows: The patient was tired and nauseous about 3 hours after her vaccine. She had been in the hospital 16Jan2021 to 18Jan2021 for a blood clot. The patient died at her home on 20Jan2021 between 4 and 7 pm. No treatment required. The vaccine was administered at Hospital Facility. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient had not been tested for COVID-19.; Reported Cause(s) of Death: death cause: Heart Problems	No prior vaccinations for this event.	
CARDIAC FAILURE		**COVID19 (COVID19 (MODERNA)) (1201)**
EARLY SUNDAY MORNING THE PATIENT BEGAN VOMITTING AND SHORT OF BREATH AND CHEST AND BACK PAIN. SHE CODED WHEN SHE GOT IN THE ER AND LATER PASSED AWAY THE MONDAY. DIAGNOSIS WAS PNEUMONIA AND HEART FAILURE PER STEP DAUGHTER.	No prior vaccinations for this event.

Stomach upset, sudden heart failure, death No prior vaccinations for this event.

CARDIAC FAILURE **COVID19 (COVID19 (MODERNA)) (1201)**

Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal.

No prior vaccinations for this event.

The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA-1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

CARDIAC FAILURE

COVID19 (COVID19 (MODERNA)) (1201)

Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21- WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse

CARDIAC FAILURE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

She started having breathing problems/heart attack appearance. on 1/22/21 and went to the ER. Upon admittance was told it was an anaphylactic shock from the Covid shot. They kept her in ICU and released

No prior vaccinations for this event.

her 1/23/21. At 12:45 am on 1/24/21 she passed out and we called the ambulance. Hospital admitted her and worked through multiple organ failure issues and thought her numbers were under control. She was released on 1/27/21 and was driving on 1/28/21 around 4:15 pm and appears to have had heart failure and had a wreck. She passed away that day.

	CARDIAC FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident did not exhibit any side effects from the vaccine. Staff spoke with him in his room at approximately 7:20am and returned to his room just a few minutes later and he was unresponsive. When the RN got to the room he had CTB. Physician documented heart failure and end stage kidney disease on the death certificate.		No prior vaccinations for this event.
	CARDIAC FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient passed away from chronic respiratory failure with cardiogenic shock 24 hours from 2nd dose of vaccine. Patient with longstanding history of pulmonary HTN and heart failure with desire for comfort care only. Entering into VAERS out of abundance of caution.		No prior vaccinations for this event.
	CARDIAC FAILURE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
presumed cardiac failure; This is a spontaneous report from a contactable nurse. An 89-year-old female patient (not pregnant) received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm left on 10Feb2021 (at the age of 89 years) at single dose for		No prior vaccinations for this event.

COVID-19 immunization. The patient medical history included congestive heart failure, coronary artery disease, hypertension, hyperlipidemia, osteoarthritis, presence of prosthetic heart valve and allergies, all from an unknown date and unknown if ongoing. The patient's concomitant medication included amlodipine besilate/benazepril hydrochloride, amlodipine, acetylsalicylic acid (ASPIRIN E.C.), atorvastatin, benazepril, carvedilol, ubidecarenone (COQ10), furosemide, acetaminophen and potassium chloride. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0142), intramuscular at arm left on 20Jan2021 at single dose for COVID-19 immunization. The patient experienced presumed cardiac failure on 12Feb2021 at 03:30 with fatal outcome. The patient died on 12Feb2021. An autopsy was not performed.; Sender's Comments: Based on the current available information, the event Cardiac failure is most likely related to an intercurrent or underlying condition which is not related to the suspected drug BNT162B2. The patient medical history of congestive heart failure, coronary artery disease, hypertension, and hyperlipidemia provide plausible explanations for the event. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: presumed cardiac failure

CARDIAC FAILURE

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air

No prior vaccinations for this event.

saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days

prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

CARDIAC FAILURE ACUTE	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt started complaining of chest heaviness and shortness of breath on the afternoon of 1/21/21. EMS was called to the patients home and she was found to have an O2 sat in the 70's. She was admitted to hospital and found to have a proBNP of 5000. She tested negative for Covid-19. She was determined to be in acute-on-chronic heart failure and was referred for hospice care. She passed away on the evening of 1/24/21.	No prior vaccinations for this event.

CARDIAC FAILURE ACUTE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt received vaccine on 7 jan. 2021 Twelve days later, on 19 January 2021, Pt developed symptoms of	No prior vaccinations for

COVID (cough, sore throat, fever, myalgias), on 20 Jan, pt admitted to hospital for worsening symptoms. Pt tested positive for COVID 19. Pt admitted to ICU where pt had complicated hospital course to include ARDS secondary to COVID pneumonia, nonSTEMI, with biventricular heart failure, on multiple pressor, rhabdomyolysis with acute kidney injury, requiring CRRT. Pt was in hospital for 10 days; he passed away on 31 Jan 2021. this event.

CARDIAC FAILURE CHRONIC

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient did not have any adverse reaction to the COVID vaccine, but we were asked by our health dept to submit a VAERS report since the patient died between his first and second dose. Received Pfizer Dose #1 12/17/2020. No side effects or adverse events noted; lived in 24/7 care facility and monitored twice daily for reaction. Date of death 12/23/2020 from aspiration pneumonia complicated by end-stage heart failure and ischemic cardiomyopathy. Death was anticipated and not sudden.

No prior vaccinations for this event.

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no		No prior vaccinations for this event.

hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50.

Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

about 20+ hours after vaccination resident was having hard time breathing, 911 was called. Resident coded multiple times at the facility after CPR she was taken to ICU. She coded again and was placed on life support. Due to her choice to not be on life support she passed on 11/26/2021.

No prior vaccinations for this event.

CARDIO-RESPIRATORY ARREST

COVID19 (COVID19

	(MODERNA)) (1201)
UNKNOWN/ASYTOLE Narrative: Please refer to section 6. 68y/o male with h/o severe peripheral vascular disease with previous left AKA 2/3/20, s/p bilateral bypasses in the past. Pt recently underwent right AKA on 1/12/21. Per Hospital remote data 1/10/21 pt c/o shortness of breath, CXR demonstrated right lower lobe opacity & left basilar infiltrate. Pt s/p >10 days emperic IV abx. Moderna vaccine 0.5ml IM was administered via left deltoid on 1/22/21 around 16:21. On 1/23/21@05:14 code blue was called as pt found to be unresponsive, breathless and pulseless, facial cyanosis noted, CPR started immediately.Pt found to be in asystole. ACLS guideline followed but no return of spontaneous circulation, At 05:32 pt remained pulseless and breathless and was pronounced. Autopsy currently pending.	No prior vaccinations for this event.
CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
6 days after vaccine developed bloody diarrhea. Thought to have ischemic colitis but negative evaluation. became hypotensive bradycardic placed on ventilator. Subsequently was poorly responsive and eventually coded once more and succumbed	No prior vaccinations for this event.
CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
PATIENT WAS IN CLINIC FOR 1ST CLINIC. WAS DISCHARGED BEFORE OUR 2ND CLINIC. HE CAME BACK TO OBTAIN HIS 2ND SHOT. WE WENT OUT TO THE CAR GAVE SHOT. THE NEXT DAY TO MY KNOWLEDGE, HE STARTED CODING AT HOME. AMBULANCE WAS CALLED AND HE CONTINUED TO CODE. THE AMBULANCE CREW TRIED CPR FOR 30 MINS WITH NO LUCK. PATIENT PASSED 2-3-21.	No prior vaccinations for this event.
CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**

CARDIAC ARREST, DEATH Narrative: The patient presents to the emergency department in cardiopulmonary arrest. CPR was continued upon arrival. The Combi tube was removed and an endotracheal tube was placed without complications. ROSC was obtained multiple times but the patient continued to go into PEA. The patient was seen in the emergency department by both critical care and Cardiology. EKG shows ST elevations, but the patient was unstable to go to catheterization. The patient had 1 episode of asystole. Despite best efforts and multiple attempts we were unable to resuscitate the patient. Time of death 1253 on 1/24/21.	No prior vaccinations for this event.
CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
EARLY SUNDAY MORNING THE PATIENT BEGAN VOMITTING AND SHORT OF BREATH AND CHEST AND BACK PAIN. SHE CODED WHEN SHE GOT IN THE ER AND LATER PASSED AWAY THE MONDAY. DIAGNOSIS WAS PNEUMONIA AND HEART FAILURE PER STEP DAUGHTER.	No prior vaccinations for this event.
CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
pt received vaccine on 2/3. early on 2/4 developed chest pain, dyspnea, and was seen in ED and diagnosed with acute exacerbation of CHF and NSTEMI type 2, and anemia. on 2/5 transfusion was started and pt developed worsening dyspnea and then PEA arrest. Pt achieved ROSC and was transferred to the cardiac intensive care unit where he required vasopressor support. he subsequently declined and died on 2/7	No prior vaccinations for this event.
CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
"02/08/21--2 days after vaccine--Resident stated that she ""didn't feel good"" (She is developmentally delayed and less able to communicate how she feels than those in the community) and stopped eating most foods; also had fatigue. Vitals, coloring, & behavior were normal. 02/09/21--Belly was firm and mildly distended	No prior vaccinations for this event.

(although she stated it didn't hurt); she coded this evening and CPR was performed before EMT could transport her to the hospital. 02/10/21--Resident passed."

CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident reviewed for incident. Resident received the second dose of the Moderna Covid-19 vaccine lot# 016M20A Exp 5/2/2021 on 2/5/2021 from clinic through pharmacy. Resident had her temp/O2 taken on AM shift and was 98.6/93%, beginning PM shift 98.4/95%. A few hours later noted that resident to have chills and was shaking RN assessment completed and vitals taken resident noted to have temp of 102.2, oxygen 95%, pulse 110. Resident alert and oriented at that time and talking to staff. Reported findings to APNP with order to send to ER. 911 called, residents brother updated. Upon EMT arrival RN went down to residents room with EMT and resident had an emesis as resident was getting cleaned up resident went unresponsive. Pulse noted to still be present at that time, resident did briefly respond to sternal rub and then went unresponsive again. Resident full code and EMT transferred to gurney and said that if they lost a pulse in route that they would transfer to hospital B instead of hospital A being the closest facility. RN called brother and gave update. Facility notified from Hospital that resident had passed away.	No prior vaccinations for this event.

CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (MODERNA)) (1201)**

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported

No prior vaccinations for this event.

to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Staff member checked on her at 3am and patient stated that she felt like she couldn't breathe. 911 was	No prior vaccinations for

called and taken to the hospital. While in the ambulance, patient coded. Patient was given CPR and ""brought back"". Once at the hospital, patient was placed on a ventilator and efforts were made to contact the guardian for end of life decisions. Two EEGs were given to determine that patient had no brain activity. Guardian, made the decision to end all life saving measures. Patient was taken off the ventilator on 1/9/2021 and passed away at 1:30am on 1/10/2021. The initial indication from the ICU doctor was the patient had a mucus plug that she couldn't clear."

this event.

CARDIO-RESPIRATORY ARREST	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
resident coded on 09Jan at 8am and expired; This is a spontaneous report from a contactable Other Health Professional. A 70-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140), intramuscularly in left arm on 05Jan2021 15:15 at single dose for COVID-19 immunization. Medical history included DM2(Type two diabetes mellitus), CHF(congestive heart failure), open wound, wound infection, heart failure. Allergies to medications, food, or other products: none. Concomitant medications included unspecified products (List of any other medications the patient received within 2 weeks of vaccination: yes). If the patient received any other vaccines within 4 weeks prior to the COVID vaccine: Unknown. Facility where the most recent COVID-19 vaccine was administered: Nursing Home/Senior Living Facility. The resident coded on 09Jan2021 at 8 AM and expired. The patient died on 09Jan2021. An autopsy was not performed. AE resulted in: patient died. Death cause: unknown at this time. Was treatment received for the adverse event: Unknown. Prior to vaccination, was the patient diagnosed with COVID-19: No. Since the vaccination, has the patient been tested for COVID-19: No. Serious: Yes. Seriousness criteria-Results in death: Yes. Seriousness criteria-Life threatening: No. Seriousness criteria-Caused/prolonged hospitalization: No. Seriousness criteria-Disabling/Incapacitating: No. Seriousness criteria-Congenital anomaly/birth defect: No.; Sender's Comments: The old patient had diabetes mellitus, congestive heart failure, open wound complicated by infection, all these pre-existing medical conditions contribute to the patient death. More information including complete medical history, concomitant	No prior vaccinations for this event.

medications and event term details especially death cause and autopsy results are needed for a full assessment of the case. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate; Reported Cause(s) of Death: resident coded on 09Jan at 8am and expired

CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at	No prior vaccinations for this event.

time of this report."

CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no	No prior vaccinations for this event.

peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

	CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was coded and expired Code Blue: Patient was in dialysis, after 30 minutes his sbp dropped to 60s he was given 4 albumin. Patient who was responsive before that became unresponsive, had seizure like activity, lost pulse and spontaneous breathing. HD stopped. Code called. Cpr started. A few minutes into cpr patient started to profusely bleed - gi bleed and ventilation became very hard., intubation was very difficult and ventilation hard as we suctioned large amounts of aspirated blood. Patient was eventually intubated. More than 8 doses of epi ws given, sodium bicarbonate * 2 given with continuous cpr. It was mostly PEA with one shockable rhythym. And shock delivered for vfib. patient continued to profusely bleed, og insertion was not successful and effective ventilation was very tough due to massive aspiration,. Possible variceal rupture with cpr from his cirrhosis is likely scenario. After 30 minutes of unsuccessful ventilation and acls protocol. Code was stopped.		No prior vaccinations for this event.
	CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Few minutes post vaccination, after moving to observation area via wheelchair, the patient complained of dizziness. She took glucose tabs she had brought with her. Staff wheeled her to Triage # 1. Her eyes rolled back in her head and she lost consciousness. Staff (paramedics on site) transferred her to gurney and started compressions. AED placed, V- Fib was rhythm, Shock # 1 given, CPR resumed. Shocked again. Fire truck and additional EMT arrived on site and took over care. Epinephrine was given 3 times via intra-osseous route, Amiodarone given intra-osseous route. Additional defibrillation with on site AED for a total of 6-7 times. Patient had good chest rise with ambu-bag, no airway obstruction or peri-oral edema noted. Code called at 12:40 PM.		No prior vaccinations for this event.

	CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Pt develops left leg pain The day after vaccination in AM subsequently drove approximately 150 miles On his way back stopped at his brothers place for lunch. He then collapsed coning down the steps, EMS started CPR. took him to ER Resuscitated briefly but went into CardioPulm Arrest again and PEA Resucitaion for aprox 1 hour but was unsuccessful. Noted to have Left leg more swollen than Right by 3 to 4 CM presumed to have died from massive Pulmonary embolism and inferior wall myocardial ischemia		No prior vaccinations for this event.
	CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received his first dose of Covid vaccine on Jan. 30, 2021. On Jan 31, 2021 at 6:08 AM, patient noted unresponsive per facility. Code blue was called and 911 dispatched. He expired in the ER.		No prior vaccinations for this event.
	CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident received the 2nd dose of the Covid vaccine approximately around 1105 by pharmacy through the pharmacy LTC partnership vaccination program. Resident had no adverse effects until around 8:00 pm she began complaining of body aches, and chills, Tylenol was given at this time. Around 9:30pm resident was sleeping in bed. Around 12:00 am the CNA called nurse into room to assess resident as the resident stated she did not feel good. Temperature at that time was 102.2, and vomiting. RN came to assess @ 1220 am She was noted to be vomiting, diaphoretic, pale and having trouble breathing. Temp was 97.3 after vomting, Pulse 53, Resp 20, o2 sats were 40-45%, unable to obtain Blood pressure, Applied 5 L of oxygen at this time and had LPN call 911 immediately. Resident was repsonsive and able to follow staff members instructions but was only answering yes or no simple questions at the time time of assessment. Paramedics		No prior vaccinations for this event.

arrived at 0040 and resident was sent to Hospital. @ 0130 ER nurse called to nursing facility to notify resident had coded in the ER and passed away @ 0110.

CARDIO-RESPIRATORY ARREST

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to

No prior vaccinations for this event.

be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased	
CARDIO-RESPIRATORY ARREST	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received the vaccine around 11 am. He hadn't been feeling well (headache, dizziness) per report and initially called in to work. He then decided to come to work and was found down in a patient bathroom during his shift on our Facility while taking care of a patient (he was a nurse aid). Patient was coded and the team and was transferred to our Facility ED. He expired 3/3 2112	No prior vaccinations for this event.
CARDIO-RESPIRATORY DISTRESS	**COVID19 (COVID19 (MODERNA)) (1201)**
Fever Feeling tired short of breath all night and morning after the vaccine My grandma had to be intubated and then passed away to a heart distress we think it was the vaccine because she was fine even with dialysis. When she got the vaccine it took hours and her health conditions changed.	No prior vaccinations for this event.
CARDIOGENIC SHOCK	**COVID19 (COVID19 (MODERNA)) (1201)**
Resident c/o nausea evening of 1/29 (nausea common for her post dialysis), had a large emesis at approx 2220, 0030 (unusual for resident to vomit)- received Zofran per order. Skin cool and damp, Blood sugar 147 (checked due to h/o diabetes and poor intake). At approx 230am Blood pressured checked and noted to be 52/29. Resident transferred to ER, intubated and transferred to higher level of care where she passed away	No prior vaccinations for this event.

on 1/30 at 736pm. Resident's medical notes indicated likely shock, cardiogenic in nature, sepsis (source unknown) along with a multitude of other co-morbidities that resident has.

CARDIOGENIC SHOCK	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient passed away from chronic respiratory failure with cardiogenic shock 24 hours from 2nd dose of vaccine. Patient with longstanding history of pulmonary HTN and heart failure with desire for comfort care only. Entering into VAERS out of abundance of caution.	No prior vaccinations for this event.
CARDIOGENIC SHOCK	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Cardiogenic shock occurred on 2/10/2021, approximately 12 hours after patient received her 12th dose of pemetrexed/pembrolizumab and 4 days after COVID vaccine. Coronary angiography was done on 2/10/2021 and no significant coronary narrowing or blockage were noted. Baseline troponin on 2/10/21 was 0.02 and later on 2/10/21, troponins were 9.99 & 25.27. Creatinine increase from 1.2 to 3.4 within 24hours, and AST/ALT increased from 23 & 31 to 4,220 & 4,786 respectively on 2/11. Patient expired on 02/11/2021.	No prior vaccinations for this event.
CARDIOMEGALY	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt. was admitted to hospital on 1/6/21 with fatigue, weakness. Pt. was Covid positive in November of 2020. Impression upon admission was fatigue may be due to her aortic stenosis and some hypertensive issues with blood pressure changes. She was anemic. WBC was elevated to 19.2, HBG 10.5, NA-131, K+ - 3.1, Rule out bacterial infection. Potential source could be her heart valve. Also noted to have acute renal failure with BUN of 47 and Creatinine of 2.2 noted. Pt. was transferred to Hospital on 1/8/2021 with dx of aortic stenosis,	No prior vaccinations for this event.

bacteremia, ARF, Dehydration and anemia. Discharged with dx. of sepsis. Pt. expired on 1/18/21 with dx. of severe sepsis, complete heart block, staphylococcus epidermidis bacteremia.		
CARDIOMEGALY		**COVID19 (COVID19 (MODERNA)) (1201)**
"Resident complained of feeling ""hot"" at supper time. Had emesis an hour or so later. Became hypoxic and was transferred to the hospital emergency room. Her evaluation in the ED revealed continued presence of UTI, leukocytosis (19.8), and renal insufficiency (BUN 22 Cr. 1.3) BP 99/63; P 74; Temp 98.1; RR 16; and O2 sat of 95% with 2 LPNC (she is typically on RA). CXR reported changes most consistent with CHF with cardiomegaly and bilateral pulmonary vascular prominence. Bibasilar pleural effusions greater on the right than left with pulmonary edema. Large hiatal hernia and likely old chronic wedge defromities involving the mid thoracic vertebral body. She was admitted for IV antibiotics. She expired 2/6/2021"		No prior vaccinations for this event.
CARDIOMEGALY		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
right arm swelling immediately after injection. followed by bilateral lower leg edema, chills and body aches that continued daily at 2 weeks post immunization admin 2/4/21 treated with dexamethasone 6mg PO x 7 days- this resolved his s/s 2/13/21 patient passed away at facility		No prior vaccinations for this event.
CARDIOMYOPATHY		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient had Covid-19 in October of 2020. He recovered. He received the vaccination on 12/30/2020 with no complaints. On 01-05-2021 it was noted to he was incontinent of urine and bilateral lower extremity edema. Lab work was completed showed acute kidney injury. He had decreased blood pressure and oxygen saturations on 01-06-2021 He was admitted to the hospital with rapid progression of symptoms and		No prior vaccinations for this event.

suggested multi-system failure. He had a long cardiac history. On 01-14-2021 he passed away with a diagnosis of Cardiomyopathic CHF, A.Fib contributory.

CARDIOMYOPATHY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.	No prior vaccinations for this event.
CARDIOVASCULAR DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
"My grandpa had a stroke on the 15th of February. He claimed he had been feeling ""off"" for a few days, but didn't say anything. A blood clot had formed in his brain. He was doing better and about to go to rehab to strength his right side of his body. On the 22nd he took a turn for the worst. He was having trouble breathing and they sedated and partially paralyzed him to put a tube in his mouth. I believe another blood clot had formed and oxygen wasn't properly going through his body. They could not stabilize him, and he passed away the same day."	No prior vaccinations for this event.

	CARDIOVERSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient arrived at ER with complaints of CPR in progress. Per EMS, patient became short of breath while performing yard work on 1/26/2021. At arrival, patient was in fine v fib with a total of 6 shocks delivered along with 300 mg amiodarone followed by 150 mg amiodarone, 1 amp epinephrine and 2 epinephrine drips adminstered en route to ED. CPR initiated at 1755 and EMS reports asystole at 1829. TOD 1909 pronounced by ED DO Dx: Cardiac arrest		No prior vaccinations for this event.
	CARDIOVERSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Per EMS, the patient was last seen walking and talking to wife 10 minutes prior to EMS arrival. EMS reports via patients wife, that patient was upstairs to change for his doctor appointment then patient's wife found him down. The patient received his COVID-19 vaccine on 1/25/21. EMS states they gave 5 rounds of EPI then patient moved into vfib then was shocked once but returned to asystole. In ED, the patient initially in asystole CPR was started immediately. The patient was given 3 rounds EPI, 1 round bicarb. The patient stayed in PEA throughout. Patient was given tPA. Patient continued to be in asystole and time of death was called at 11:35 am.		No prior vaccinations for this event.
	CARDIOVERSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was		No prior vaccinations for this event.

able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

CARDIOVERSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1/28/2021- Seen by FNP for indigestion, chest pressure and palpitations. EKG reviewed and referral made to Cardiology. 1/29/2021-1800 Presented to ED in cardiac arrest-onset PTA. Patient was found unresponsive by his wife at their home. The last known well was at 1530 when she called him on the phone. The patient was pronounced at ~1850.	No prior vaccinations for this event.
CARDIOVERSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received the vaccine at an outside healthcare facility on 2/11/21. At approximately 1 pm she screamed out and fell out of her chair. EMS was called and patient was found to be in Vfib. ACLS was	No prior vaccinations for this event.

performed for approximately 42 minutes prior to arrival at ED. At that time the patient had been pulseless for 25 minutes. Patient received 450 mg of amiodarone, epinephrine x7, sodium bicarbonate x2, and 7 AED shocks. In the ED 3 more doses of epinephrine were given, one more dose of sodium bicarbonate, and 5 additional shocks. ROSC was not achieved and time of death was called at 1416.		
	CARDIOVERSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Few minutes post vaccination, after moving to observation area via wheelchair, the patient complained of dizziness. She took glucose tabs she had brought with her. Staff wheeled her to Triage # 1. Her eyes rolled back in her head and she lost consciousness. Staff (paramedics on site) transferred her to gurney and started compressions. AED placed, V- Fib was rhythm, Shock # 1 given, CPR resumed. Shocked again. Fire truck and additional EMT arrived on site and took over care. Epinephrine was given 3 times via intra-osseous route, Amiodarone given intra-osseous route. Additional defibrillation with on site AED for a total of 6-7 times. Patient had good chest rise with ambu-bag, no airway obstruction or peri-oral edema noted. Code called at 12:40 PM.		No prior vaccinations for this event.
	CARDIOVERSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Pt received 2nd Pfizer BioNTech Covid 19 EUA vaccine @1:50 pm; Pt released from Observation @2:09 pm. Approximately 2:18 pm RN called to parking lot and observed pt having difficulties. CEREBROVASCULAR ACCIDENT

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

My mother had a stroke on 28Jan2021 sometime after 9:30 AM the morning after getting the first dose of the Pfizer Covid vaccine; Cerebral infarction; This is a spontaneous report from a contactable consumer (reporting for mother). A 94-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date unknown as not available or provided to reporter at the time of report completion) via an unspecified route of administration on 27Jan2021 in right arm at single dose for COVID-19 immunization. Medical history included coronary artery disease and hypertension. There were no concomitant medications. The patient was not pregnant. No other vaccine was received in four weeks. The patient did not have covid prior vaccination and not have covid tested post vaccination. The patient had a stroke on 28Jan2021 sometime after 9:30 AM the morning after getting the first dose of the Pfizer Covid vaccine and was hospitalized due to stroke for 6 days from Jan2021. The patient then experienced cerebral infarction in 2021 and died due to it on 04Feb2021. Treatment received for events stroke and cerebral infarction included tPA injection. The outcome of events stroke and cerebral infarction was fatal. An autopsy was not performed. Information on the lot/batch number has been requested.; Reported Cause(s) of Death: Cerebral infarction	No prior vaccinations for this event.
CEREBROVASCULAR ACCIDENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Cardiac Event MI or Stroke; Cardiac Event MI or Stroke; This is a spontaneous report from a contactable consumer (Son in law). A 73-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at left arm on 17Feb2021 14:00 at single dose for covid-19 immunisation. Medical history included atrial fibrillation (AFib), prostate cancer Survivor. Concomitant medication included alirocumab (PRALUENT), escitalopram oxalate (LEXAPRO), apixaban (ELIQUIS), nitroglycerin and Ca channel blocker. The patient received the first dose of BNT162B2 on an unknown date for covid-19 immunisation. The patient experienced cardiac event myocardial infarction (MI) or stroke on 17Feb2021. Adverse event result in Doctor or other healthcare professional office/clinic visit. It was unknown if treatment received for the events. Prior to vaccination, the	No prior vaccinations for this event.

patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The patient died on 19Feb2021. It was unknown if an autopsy was performed. The outcome of the events was fatal. The reporter didn't know if this was associated or not. Information on the lot/batch number has been requested.; Reported Cause(s) of Death: Cardiac Event MI or Stroke; Cardiac Event MI or Stroke		
	CEREBROVASCULAR ACCIDENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
After the second vaccine dose she reported not feeling well with unspecified symptoms for a few days. On February 18th, 2021 she visited her doctor with numbness in her hand. They thought it may be carpal tunnel and sent her home. The morning or March 18th , 2021 she had a severe stroke and was transferred to Hospital and then to other hospital. She was in the hospital until Tuesday March 23rd when she was transferred back to her home for hospice care. She died on March 26th, 2021.		No prior vaccinations for this event.
	CEREBROVASCULAR ACCIDENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Developed acute facial droop and slurred speech 2h after 1st dose of the vaccine on 2/17, found with R MCA stroke. Then became unresponsive on 2/27 and was found with an acute L MCA stroke. Was transferred from another hospital, was not a candidate for intervention, and was made comfort and died on 2/28		No prior vaccinations for this event.
	CHEMOTHERAPY	**COVID19 (COVID19 (MODERNA)) (1201)**
chills 1 day after vaccine administration; found dead by family 1/18/2021 Narrative: Per patient family report, patient said the next day after vaccination that he didn't feel well because of chills. Patient was found dead		No prior vaccinations for

at home by his family on January 18th. He was a 74yo man with castrate resistant prostate cancer and liver and bone metastases with rising PSA, status post intravenous chemotherapy 1/7/21 this event.

	CHEMOTHERAPY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg		No prior vaccinations for this event.

of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well.

Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure""""

CHEST DISCOMFORT		**COVID19 (COVID19 (MODERNA)) (1201)**
Clients wife reported on 1/18/2021, that her husband died unexpectedly the day after receiving the COVID 19 vaccine. I called and spoke with her. She stated that the client had started experienced some tightness in his chest the evening of 1/11/2021. She stated that it was normal for him to have the tightness in his chest if he got stressed. She stated that she found him on the garage floor on 1/12/2021 at 2120. He was taken by ambulance to the hospital. She stated that the hospital told her that his COPD had caused him to go into arrythmia.		No prior vaccinations for this event.
CHEST DISCOMFORT		**COVID19 (COVID19 (MODERNA)) (1201)**
Pt started complaining of chest heaviness and shortness of breath on the afternoon of 1/21/21. EMS was called to the patients home and she was found to have an O2 sat in the 70's. She was admitted to hospital and found to have a proBNP of 5000. She tested negative for Covid-19. She was determined to be in acute-on-chronic heart failure and was referred for hospice care. She passed away on the evening of 1/24/21.		No prior vaccinations for this event.

(1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

CHEST PAIN

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off

No prior vaccinations for this event.

to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

CHEST PAIN

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

For the two days prior to presentation the patient had been complaining of chest pain, his breathing seemed to be labored Monday. He and the family thought the pain was due to shingles as he carried this diagnosis from a month ago. Patient had also received the COVID vaccine 2 days prior to presentation and assumed he was feeling unwell due to the vaccine. Family wanted to take him to the hospital yesterday and earlier today but he refused. She left him in his home earlier this afternoon prior to presentation and returned to check on him finding him unresponsive and apneic at which time EMS was activated. #cardiac arrest -- suspect primary cardiac given collateral from family at home, consider hypoxemia which was corrected with advanced airway and 100% FiO2, patient clinically euvolemic and with soft brown stool in diaper not

No prior vaccinations for this event.

suggestive of GI hemorrhage, attempt to address acidosis with CPR and bicarbonate, not hypoglycemia, on bedside ultrasound FAST neg and no pericardial effusion suggestive of tamponade and +lung sliding bil not spontaneous pneumothorax Assessment/Diagnosis: -cardiac arrest, cause unspecified

	CHEST PAIN	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
pulmonary edema; Low heart rate; chest pain; This is a spontaneous report from a contactable pharmacist. An 80-years-old male patient received his second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left arm on 28Jan2021 at single dose for COVID-19 Immunisation. Medical history included dementia, high blood pressure, COVID prior vaccination. He had no known allergies. Concomitant medication included diltiazem hydrochloride (CARDIZEM), anastrozole (ARIMIDEX), simvastatin and lorazepam. Historical Vaccine included first dose of BNT162B2 (PFIZER-BIONTECH		No prior vaccinations for this event.

COVID-19 VACCINE) on 07Jan2021 (at the age of 80-years-old) at single dose for COVID-19 Immunization. There was no other vaccine received in four weeks. The patient experienced pulmonary edema, low heart rate and chest pain on 26Feb2021. The events resulted in hospitalization and patient died. The patient was hospitalized from 26Feb2021 for 1 day. Treatment received for the events included Epinephrine, morphine, nitroglycerine. The patient underwent lab tests and procedures which included Covid test Nasal Swab post vaccination on 26Feb2021 indicated Negative. The patient died on 26Feb2021. An autopsy was not performed. information on the lot/batch number has been requested.; Sender's Comments: Pulmonary edema, low heart rate, and chest pain, all reported as fatal, are deemed unrelated to BNT162B2 vaccine, being rather accidental occurrences, likely favored by the patient's age and by the mentioned high blood pressure, known risk factor for cardiovascular diseases. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Low heart rate; pulmonary edema; chest pain

CHEST TUBE INSERTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate	No prior vaccinations for this event.

cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

Per ED note: Brought in ED by EMS at 1945 for acute shortness of breath and hypotension. Patient was placed on supplemental oxygen and covid test completed. Patient was placed on BiPAP to maintain oxygen greater than 90%. Found to be in metabolic acidosis. Patient became unresponsive and pulse could not be palpated. Chest compressions were initiated. ACLS medications given and pulses regained. Patient lost pulse 30 mins later and never regained pulse. Per ED noted; likely developed a PE. Passed away at 2127 No prior vaccinations for this event.

CHEST X-RAY **COVID19 (COVID19 (MODERNA)) (1201)**

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient No prior vaccinations for this event.

was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from nursing home staff report.	No prior vaccinations for this event.
CHEST X-RAY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.	No prior vaccinations for this event.
CHEST X-RAY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral	No prior vaccinations

patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every for this event.

morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral

patchy opacities

	CHEST X-RAY ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**

"Resident complained of feeling ""hot"" at supper time. Had emesis an hour or so later. Became hypoxic and was transferred to the hospital emergency room. Her evaluation in the ED revealed continued presence of UTI, leukocytosis (19.8), and renal insufficiency (BUN 22 Cr. 1.3) BP 99/63; P 74; Temp 98.1; RR 16; and O2 sat of 95% with 2 LPNC (she is typically on RA). CXR reported changes most consistent with CHF with cardiomegaly and bilateral pulmonary vascular prominence. Bibasilar pleural effusions greater on the right than left with pulmonary edema. Large hiatal hernia and likely old chronic wedge defromities involving the mid thoracic vertebral body. She was admitted for IV antibiotics. She expired 2/6/2021"	No prior vaccinations for this event.
CHEST X-RAY ABNORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡	No prior vaccinations for this event.

enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

CHEST X-RAY ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Pt received second Moderna Vaccination on 2/21/21 at 1:00 pm at Pharmacy. Pt present on 2/22/21 to ER via ambulance at 1940. Upon presentation C/C hypotension Post COVID vaccine. Nurse notes states that Home Health nurse sent patient to ER secondary to hypotension and hyperglycemia. Pt states back ached and was holding his head. Nurse noted pt had random petechiae over body and bruising to abdomen following injections received during recent hospitalization. (unknown hospitalization). Patient was treated with IVF bolus in addition to initiating Dopamine for hypotension, patient became agonal and daughter at bedside presented Adv. Directive, pt was DNR. Pt pronounced time of death was 2110pm. (Pt only reported a sore shoulder secondary to vaccine).

CHEST X-RAY ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of

No prior vaccinations for this event.

breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

CHEST X-RAY ABNORMAL

COVID19 (COVID19 (MODERNA)) (1201)

Several days after vaccination his left arm turned red. He was taken to the hospital where he was

evaluated and admitted with a diagnosis of left axillary vein thrombosis. A chest X-ray was taken and he presented bibasilar atelectasis and pneumonia with pleural effusions.		this event.
	CHEST X-RAY ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient developed 104.4 temp approximately 48 hours after being given the vaccine. I treated him with antibiotics, IV fluids, cooling methods. CXR does show a new right perihilar infiltrate. However, his fever came down within the next 24-48 hours. Unfortunately, he suffered a cardiac arrest on 1/21/21 in the early morning and expired.		No prior vaccinations for this event.
	CHEST X-RAY ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some		No prior vaccinations for this event.

interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with

radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

2/12/2021 Vaccine 2/13/2021 Weakness, oral ulcers 2/17/2021 Brought to ER for loss of consciousness, altered mental status, rectal bleeding; work up showed sepsis, UTI, anemia, pneumonia, pleural effusion, pancytopenia, hypotension; persistent hypotension and respiratory failure 2/18/2021 Passed away at 5:54AM	No prior vaccinations for this event.
CHEST X-RAY ABNORMAL	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation:	No prior vaccinations for this event.

tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal

relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

Pt presented to ER with SOB on 01-29-2021. He was admitted to Healthcare with acute CHF exacerbation, elevated lactate, anemia and elevated d-dimer. Pt reports getting SOB getting up to go to the bathroom. Pt was intubated. He developed pulmonary edema. Pt expired on 02-02-2021 at 10:13 PM.	No prior vaccinations for this event.	
CHEST X-RAY ABNORMAL		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-	No prior vaccinations for this event.	

2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed

No prior vaccinations for this event.

troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on

2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

High grade MDS; Multiorgan failure; Pancytopenia; shortness of breath; Inflammatory marker increased;		No prior vaccinations

Chills; Fever; Fatigue; A spontaneous report was received from a healthcare provider concerning a 71Years-old female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and who experienced chills, fever, fatigue, pancytopenia, shortness of breath (dyspnoea), multi organ failure, and myelodysplastic syndrome (MDS). The patient's medical history was reported to include Breast Cancer and mastectomy. No relevant concomitant medications were reported. On 16 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch:unkown) intramuscularly for prophylaxis of COVID-19 infection. On 16 Jan 2021, The patient experienced events like chills, fever, and fatigue. On an undisclosed date, the patient was admitted to the hospital for shortness of breath. Laboratory details include Bone Marrow biopsy with abnormal results such as showed high grade MDS with 19% blasts. Blood work done with normal results. Body temperature results came out 103 degrees Fahrenheit. On 30 Jan 2021 the patient experienced worsening shortness of breath and was intubated. Her IL-6 was very high, and she had profound liver failure. She ended up needing pressors and requiring continuous renal replacement therapy. Treatment included steroids. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Feb 2021. The cause of death was reported as high grade MDS. An autopsy was planned.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

for this event.

On December 17, 2020, my husband, received his first BioNTech BNT162b2 COVID-19 vaccination. On Thursday January 7, 2021, he received this second COVID-19 vaccination. The following three days after his second vaccination, he felt fine. The fourth day, on Sunday January 10, my husband felt extremely fatigued. On Monday the 11th and Tuesday the 12th, he worked a full shift but complained of extreme fatigue and extreme chills to the point that his teeth were chattering while on the phone with me. He decided to work through it. When he got home on Monday night, he started vomiting. On Wednesday January 13, he woke up and had swollen eyes. Once again, he felt extremely fatigued, even after a full nights rest. He had the day off but had an early meeting. After his meeting, he was still tired so he went back to sleep. I left to get lunch, and drop off our kids, and upon my return, I found him on the walk in closet floor, face up, having passed away. He felt as cold as ice. The rapid test done after they called the paramedics resulted in a negative COVID-19 test for him.		No prior vaccinations for this event.

CHROMATURIA

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report

No prior vaccinations for this event.

she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

CHROMATURIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L	No prior vaccinations for this event.

of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

CLOSTRIDIUM DIFFICILE INFECTION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My dad received the Pfizer vaccination on 2/5/21. He was admitted into the hospital the next day for C-Diff bacterial infection. He had been on dialysis treatments for kidney failure treatment since 2017 and had recently been diagnosed with stage 3 colon cancer in June 2020. He had completed his final treatment of	No prior vaccinations for this event.

chemotherapy on 2/4/21 and several weeks prior had been determined cancer free. On Tuesday 2/9/21 he was released from the hospital and went home. Early Thursday morning 2/11/21 @ approximately 1:30 am CST his eyes rolled back in head and he stopped breathing and was non responsive. My mother called 911 and attempted CPR. Paramedics arrived and were able to successfully get a pulse then transferred him to the hospital. He was put on a ventilator @ the hospital and then transferred to a different hospital a few hours later. He lost pulse/heartbeat several times @ the 2nd hospital he was transferred to. We were not allowed to travel with him or see him b/c of all of the COVID restrictions. We were communicating with the ICU doctor by phone who ultimately communicated to us that there was nothing further that could be done to save his life. He subsequently passed away @ approximately 8:55 am CST on 2/11/21.

COAGULATION TEST	**COVID19 (COVID19 (MODERNA)) (1201)**
1/24/21 0445- patient presents to the ED with complaints of neck pain, chest pain, and back pain for about a week. States also feels SOB, intermittent fever with temperature 100.3 on arrival. Patient was worked up for his cardiac type symptoms, found to have elevated WBC and CRP with no explanation. D-Dimer was elevated with CT showing no sign of PE. Patient was sent home from the ED with instructions to follow up with primary care and/or return if s/s worsen. 1/24/21 1705- patient is returned to the ED via ambulance after becoming unresponsive and some seizure like activity. Patient was intubated. Head CT showed large brain bleed that was irreparable and not compatible with life. Patient was also found with positive blood cultures x2 with gram positive cocci in clusters growing after 9 hours.	No prior vaccinations for this event.

COAGULOPATHY	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received vaccination on 1/15/2021. Hemorrhagic Stroke on 1/20 , then diagnosed with complicated idiopathic coagulopathy	No prior vaccinations for this event.

COGNITIVE DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
unresponsive Narrative: 74yo patient with pacemaker, type 2 DM, parkinson's and history of syncopal epsisodes presented to emergency dept on Jan 24th. He was observed and discharged on Jan 26th back to the home where he continued to have cognitive decline and later passed away on 2/2/2021	No prior vaccinations for this event.
COGNITIVE DISORDER	**COVID19 (COVID19 (MODERNA)) (1201)**
Narrative: 89yo with type 2 DM, HT, pacemaker and prior COVID+ in Nov 2020. Shortly after administration of 2nd Covid vaccine, patient began to have increased cognitive decline and 2 days after he expired at the facility	No prior vaccinations for this event.
COGNITIVE DISORDER	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
[COVID-19 Vaccine] treatment under Emergency Use Authorization(EUA): He presented 10 days after first COVID-19 Vaccine with Progressive neurological deficits with bulbar manifestations - dysarthria, dysphagia and bilateral arm weakness and incoordiantion, worse on right. MRI brain was negative for acute stroke and MRI cervical, showed degenerative changes. Transferred from community hospital to tertiary center where the diagnosis was made of AIDP. He was intubated at that time in Neuro ICU. Given Steroids and IVIG but no improvement and was either will need to have Trach and PEG vs CMP and family honored the patient's wishes and made him CMO. signs of severe demyelination and AIDP was diagnosed.	No prior vaccinations for this event.
COLD SWEAT	**COVID19 (COVID19 (MODERNA)) (1201)**

Pt received second dose of COVID vaccine on 01/20/2021 at 1430. At 1600 Pt developed a wet productive cough with coarse crackles. Pt ate dinner at 5 pm cough persisted. At 18:30 the nurse went to Pt's room to give him his medications. Pt still had a cough, denied shortness of breath. Pt was in a good mood and joking with staff. Pt asked to be shaved. At 19:45 Pt was sitting in the lounge and a CNA noticed that Pt was pale/white in color and clammy. 02 Sat was 85%. Respirations were labored. Pt was placed on 4 L of 02. Increased to 5 L via face mask and 02 sat was 89-90%. Ambulance was called at unknown time. Pt arrived at Medical Center at 2120 and was pronounced dead at 2127.		No prior vaccinations for this event.
COLD SWEAT		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient presented to the Emergency Department complaining of chest pain, pale, cool diaphoretic, and hypotensive. The patient was discovered to have a large saddle pulmonary embolism, went into cardiac arrest and expired. Of note, the patient received her second Moderna COVID vaccine on 1/23, which would place her first one approximately 12/25 if she received them at the appropriate interval. This information is from the patient's daughter and the ED record, the information is not available in CAIR. Per the daughter, the patient started feeling ill on 1/21, improved on 1/25, and then acutely worsened on 1/27, resulting in the ED visit.		No prior vaccinations for this event.
COLD SWEAT		**COVID19 (COVID19 (MODERNA)) (1201)**
Resident c/o nausea evening of 1/29 (nausea common for her post dialysis), had a large emesis at approx 2220, 0030 (unusual for resident to vomit)- received Zofran per order. Skin cool and damp, Blood sugar 147 (checked due to h/o diabetes and poor intake). At approx 230am Blood pressured checked and noted to be 52/29. Resident transferred to ER, intubated and transferred to higher level of care where she passed away on 1/30 at 736pm. Resident's medical notes indicated likely shock, cardiogenic in nature, sepsis (source unknown) along with a multitude of other co-morbidities that resident has.		No prior vaccinations for this event.

COLD SWEAT		**COVID19 (COVID19 (MODERNA)) (1201)**
"Possible heart attack on 2/5/21. Complaint: "" On Feb 5th I believe I experienced a mild hear attack"" (Comment: He said he felt ""clammy, sweaty, excruciating pain on my left side - including his left arm, and left leg, dizzy, exhausted."" This happened after work, and after taking a shower. He said that was the first time he's experienced it, and that it has not happened since then. He said he has constant headaches, ""It just went away yesterday.""""		No prior vaccinations for this event.
COLITIS		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Began having SOB and cough on 2/18/21, the day after his first vaccine. Had a routine physician appointment for diabetes on 2/15/21 with no documentation of these complaints. Presented to the hospital on 2/23, soon after required intubation. Admitted with severe pneumonia, diffuse colitis, and sepsis. Condition continued to worsen until patient passed away on 2/24/21 @ 1632.		No prior vaccinations for this event.
COLITIS ISCHAEMIC		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Received Pfizer Covid Vaccine in the AM on 2/9/21. Arrived to emergency department later the same day complaining of nausea, weakness, fatigue, Vomiting, Diarrhea. Post operative diagnosis, Ischemic colon/toxic megacolon.		No prior vaccinations for this event.
COLONOSCOPY NORMAL		**COVID19 (COVID19 (MODERNA)) (1201)**

Received Moderna #1 on 1/12/2021. 1/15/2021 developed worsening shortness of breath. Went to hospital and diagnosed with anemia, 4 negative fecal tests, neg EGD and colonoscopy. Discharged and readmitted (circumstances unknown for this episode) then readmitted a third time 1/20/2021 for shortness of breath. Diagnosed covid + at third hospitalization and continued to get worse. He died 1/23/2021.

No prior vaccinations for this event.

COMA

COVID19 (COVID19 (MODERNA)) (1201)

Passed away; Found unconscious; Coma; Lack of oxygen to the brain; A spontaneous report was received from a consumer, concerning his mother, a 71-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and passed away, prior to death, patient experienced lack of oxygen to the brain and was found unconscious and went to coma. The patient's medical history reported included seizures. Concomitant medications included phenobarbital, lamotrigine and levetiracetam. On 27 Jan 2021, approximately six days prior to the onset of events, the patient received their first of two planned doses of mRNA-1273 (lot number: 030L20A) intramuscularly for prophylaxis of COVID-19 infection. On 01 Feb 2021 at 4 am, the patient was found to be unconscious on the couch, hence she was rushed to the hospital with lack of oxygen to the brain. Later, she went into a coma, hence she was in hospital for 30 hours and then was transferred to a different hospital for a second opinion on 06-Feb-2021, where she was passed away at 02:20 PM. Treatment information was not provided Action taken with mRNA-1273 in response to the events were not applicable. The outcome of events, lack of oxygen to the brain, found unconscious and coma were considered unknown. The outcome of event passed away was fatal as she died on 06 Feb 2021 at 2:20 pm. The cause of death was not provided. Plans for an autopsy were unknown.; Reporter's Comments: This is a case of 71-year-old female subject with a history of seizures who died 6 days after receiving first dose of vaccine. Very limited information has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Passed away

No prior vaccinations for this event.

COMA

COVID19 (COVID19 (PFIZER-BIONTECH))

	(1200)
Initial pain in back of head and extreme headache. Some vomiting. At emergency, went into coma and was intubated. Hole drilled in skull to relieve pressure. MRI taken. Lot of bleeding in brain - anuerism lead to death approximately 14 hours after initial symptoms.	No prior vaccinations for this event.
COMA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The	No prior vaccinations for this event.

patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

	COMA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"He collapsed due to a cardiac arrest on Friday 15Jan and passed away on 19Jan; He collapsed due to a cardiac arrest on Friday 15Jan and passed away on 19Jan; his cardiac arrest was caused by an arrhythmia; This is a spontaneous report from contactable pharmacist via Pfizer Sales Representative. A 45-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number not reported), via an unspecified route of administration on 11Jan2021 at single dose for covid-19 immunisation. Patient had a long history of congenital heart issues. He had been stable and closely monitored for the past 20 years. He had no history of arrhythmia. The patient's concomitant medications were not reported. Patient collapsed due to a cardiac arrest on Friday 15Jan2021 and passed away on 19Jan2021. The doctors feel that his cardiac arrest was caused by an arrhythmia. Reporter reported this through the v safe app. And received a message stating reporter would be contacted by the cdc. After patient passed away reporter replied stop to v safe. But still had not been contacted by anyone. This may or may not be related. Reporter have no way of knowing. It was not reported if an autopsy was performed. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported ""collapsed due to a cardiac arrest"", ""cardiac arrest was caused by an arrhythmia"" and the administration of COVID-19 vaccine, BNT162B2, based on the reasonable temporal association. The patient's pre-existing long history of congenital heart issues might have provided alternative explanations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.; Reported Cause(s) of Death: He collapsed due to a cardiac arrest on Friday 15Jan and passed away on 19Jan; his		No prior vaccinations for this event.

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored No prior vaccinations for this event.

respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

"This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal	No prior vaccinations for this event.

right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21."

COMPUTERISED TOMOGRAM HEAD NORMAL	**COVID19 (COVID19 (MODERNA)) (1201)**
loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21	No prior vaccinations for this event.

and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to No prior vaccinations

our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall,	No prior vaccinations for this event.

our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned

positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

Concomitant medication in 2 weeks included amitriptyline hydrochloride (manufacturer unknown) 10 mg, atorvastatin (manufacturer unknown) 20 mg, dutasteride (manufacturer unknown) 0.5 mg, linaclotide (LINZESS) 290 mcg, gabapentin (manufacturer unknown) 300 mg, montelukast (manufacturer unknown) 10 mg, ramipril (manufacturer unknown) 5 mg, insulin degludec (TRESIBA) 100 unit/ml, liraglutide (VICTOZA) 18 mg/3ml solution. No other vaccine in 4 weeks. The patient experienced cardiac arrest due to pericardial effusion on 21Feb2021 14:15, fever on 13Feb2021, headache on 13Feb2021, stomach upset on 13Feb2021, on 19feb, he began to feel ill again with a fever, he felt worse on 20feb on 19Feb2021, on 21feb he went to the ER after vomiting and passing out on 21Feb2021. Events resulted in Emergency room/department or urgent care. Therapeutic measures were taken as a result of cardiac arrest due to pericardial effusion. Course of events: In Feb2021, 10 days after his 1st injection, the patient	No prior vaccinations for this event.

developed fever, headache, and stomach upset. He went for a rapid Covid-19 test (nasal swab) and it was negative on 11Feb2021. The doctor told him he might be having a delayed reaction to the vaccination. After a couple of days, he improved. On 19Feb2021, he began to feel ill again with a fever. He felt worse on 20Feb2021. On 21Feb2021 he went to the ER after vomiting and passing out and received treatment: IV fluids, diagnostic testing at ER. Rapid Covid test (nasal swab) at ER came back negative again on 21Feb2021. His heart arrested suddenly and he could not be resuscitated. CT scan results, that came back after death, showed Covid like pneumonia and pericardial effusion. The patient died on 21Feb2021 14:15. Cause of death was cardiac arrest due to pericardial effusion. An autopsy was not performed. The outcome of cardiac arrest due to pericardial effusion was fatal, of fever, headache, stomach upset was recovering, of he began to feel ill again with a fever, he felt worse was not recovered, of he went to the ER after vomiting and passing out was unknown.; Reported Cause(s) of Death: cardiac arrest due to pericardial effusion; cardiac arrest due to pericardial effusion

CONDUCTION DISORDER

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at

(1200)

Patient stated he wasn't feeling well on January 25, 2021, wasn't eating and complained of abdominal pain. Patient noted to have indigestion and was constipated. Meds provided and labs ordered. On morning of January 26, 2021, patient became weak, lethargic and hypoxic and was sent to emergency department around 0700 hours on January 26, 2021. At approximately 1100 hours, emergency physician notified this writer that patient was not going to overcome his illness and would be placed on comfort care. At approximately 1130 hours, this writer was notified that patient had passed away from multi-organ failure.

No prior vaccinations for this event.

CONSTIPATION

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were

No prior vaccinations for this event.

no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the

ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

CORONARY ARTERY DISEASE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received her vaccine on 2/2/2021 in the morning. She was observed for over 15 minutes and had no history of any anaphylactic reaction of any sort. She felt fine and went home. 2/15/2021 we were notified by her family that she had passed away on 2/7/2021 at home. The cause of death was stated as myocardial infarct secondary to coronary artery disease. We do not think it had to do with the vaccine administration. The patient had many comorbidities.	No prior vaccinations for this event.	
CORONARY ARTERY DISEASE		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient had swelling around her jaw after her second shot of the covid , Pfizer vaccine (.5 ml IM) on the Friday morning, January 29th, I took her to a follow up appointment with the cardiologist at 3:00 pm, as a follow up to a small heart attack event with hospitalization two weeks previously, at the cardiologist she was given the ok/all is well. That next morning early, she had a 911 event at her assisted living apartment and was sent back to the hospital, having had another heart attack. Patient died on the following Thursday, February 4, 2021. I do not know if the vaccination had any cause for my mothers death; but I feel it is necessary to report this series of heart attacks after she received the pfizer vaccine. Her Certificate of	No prior vaccinations for this event.	

Death records the cause of death as ""Coronary Artery Disease""."

CORONARY ARTERY DISEASE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received first dose of covid vaccine on 1/22/2021. Patient had no immediate reaction. Patient presented to the Emergency Department on 1/26/2021 c/o shortness of breath and chest pain. ECG showed a ST elevation myocardial infarction. Patient was treated and transferred to a cath lab where he died. Patient had significant coronary artery disease.	No prior vaccinations for this event.
CORONARY ARTERY OCCLUSION	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient and her husband are elderly, but healthy and live independently. Patient took blood pressure medicine 'off and on' according to family. She was 5'2"", 120 pounds and slim and healthy and active, so was her husband, though he had pulmonary fibrosis so they had been staying home and not attending church etc, and masking when they did go out to protect against covid disease. They were both vaccinated with covid Pfizer vaccine (dose #1) on Thursday Feb 11. (02/11/2021) Thursday night as they went to bed they checked in with each other on how they each felt. Patient said she felt totally fine, and her husband said his arm was a bit sore. Patient woke before her husband on Friday Feb 12, went downstairs and, from what the family can tell, fixed herself a snack, then sat on the sofa. Patient's husband found her deceased on the sofa. He called 911 and they asked him to do CPR until the paramedics arrived. Because of proximity to covid vaccine, the ME wanted to examine the body in the home and also ordered an autopsy. Autopsy was completed on the same day as death, Feb 12, 2021"	No prior vaccinations for this event.

(1200)

Sudden cardiac death. Autopsy report: right coronary artery thrombosis. No prior vaccinations for this event.

CORONAVIRUS INFECTION **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21

No prior vaccinations for this event.

COUGH **COVID19 (COVID19 (MODERNA)) (1201)**

Patient vaccinated on 12/28. Approximately one day later, develops cough and on azithromycin x 1 week. On 1/3, patient develops left-sided weakness and aphasia. Taken to the hospital, tested COVID+, required intubation -- acute hypoxic respiratory failure secondary to COVID - on H&P. Patient died on 1/4/21 at 7:20am.

No prior vaccinations for this event.

	COUGH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.		No prior vaccinations for this event.

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel	No prior vaccinations for this event.

can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the

steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory failure"""

Patient received first dose of vaccine on 1/7/21 at a community Public Health clinic. On 1/29/21 he received a second dose at the community Public Health clinic. On 2/5/21, the patient presented to the ED with complaints of shortness of breath worsening over the last 2 weeks. Patient reported that he had decreased exercise capacity and increased coughing with sputum production intermittently. Patient reported that he had been feeling chilled, but no fevers. Patient was admitted and treated with Decadron and Remdesivir. Patient experienced increased oxygen requirement. Patient was a DNI and did not want to be on life support. After discussion with the patient and family, patient was moved to comfort care. passed away on		No prior vaccinations for this event.

2/11/21.

COUGH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

"Patient received 2nd dose of the COVID-19 Pfizer vaccine, was observed in office x 15+ minutes, and released home. Pt and his son exited the building and when they got to the car, the pt shouted out ""oh no!"" and collapsed to the ground. The patient was unconscious experiencing agonal respirations, and unresponsive to painful stimuli. There is an Emergency Room at the same location. Their staff came out and helped to transfer the pt to the ED for further evaluation. It was found that the patient had a known Anterior communicating artery aneurysm (7/28/2017) that seemed to have ruptured. The patient was stabilized and transported to our local hospital and upon arrival, he was effectively comatose with a GCS 3. CT Head notated an extensive subarachnoid and intraventricular hemorrhage most probably related to a bleeding anterior communicating artery aneurysm. Neuro-Interventional Radiologist dictation reads ""Hunt Hess 5 Fisher grade 4 extensive subarachnoid hemorrhage with intraventricular hemorrhage and early hydrocephalus secondary to rupture of a known anterior communicating artery aneurysm. Initial ICP after EVD placement noted to be in the 120s now 68 treatment complicated by aneurysm rerupture after admission and increased volume of blood although large volume of hemorrhage was seen on initial scan and no change in the patient's clinical exam on her scale was noted due to this rerupture. Patient's exam and prognosis are poor giving extensor posturing lack of extraocular movements to doll's maneuver and weak pupillary reflex as well as cough and gag. Follows no commands or instructions at this time with no spontaneous movement on ventilator set at 12 overbreathing at 14-16 at this time without any sedation."" The family opted to discontinue any further treatment to include surgical intervention given the findings. The patient was given comfort care with son and daughter at the bedside. The patient was extubated and expired at 1545h on 2/13/2021."

No prior vaccinations for this event.

COUGH

COVID19 (COVID19

(PFIZER-BIONTECH))
(1200)

Death; Passed out; Stomach was bothering; Constipated; Difficulty breathing; Weakness/Event: Weakness was reported as worsened; a temperature of 99.4 degrees; Sweaty; Cold; Muscle ache; Body Aches; Diarrhea; Nausea; Vomiting; Fatigue/Tiredness; His raspy throat felt like he had mucus stuck in his throat; Cough; Raspy throat/worsened; This is a spontaneous report from a contactable consumer reporting her husband. A 75-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EM9810, Expiry Date: Jun2021) at the age of 74- year-old via an unspecified route of administration on 04Feb2021 09:15 at single dose in Arm, Right for COVID-19 immunisation. Medical history included type 2 diabetes mellitus for about 20-25 years, ongoing kidney disease from 2005, ongoing chronic kidney disease, cardiac pacemaker insertion. The patient was diagnosed with kidney disease in 2005, but it was about 1 to 1-1/2 years ago that his kidney disease progressed to Stage 4 Kidney Disease. She said the Veterans Administration diagnosed her husband with his kidney disease, but her husband saw a private doctor, as well as, a VA doctor for his care. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (Lot Number: EL3248; Expiration Date: Apr2021) at the age of 74- year-old Intramuscularly at approximately 08:45AM on 15Jan2021 in right arm for COVID-19 immunisation and had no reaction. There were no additional vaccines administered on same date of the Pfizer suspect. There were no Prior Vaccinations within 4 weeks. The patient had symptoms start earlier in the day of Tuesday, 09Feb2021, after his second COVID-19 Vaccine shot (04Feb2021). The reporter said she and her husband didn't think anything of his symptoms at first. The patient had a temperature of 99.4 degrees on 09Feb2021. She didn't check her husband's temperature again after that time because the nurse at her husband's doctor's office said her husband's temperature was not at an area of concern. The patient was sweaty, off and on, starting 09Feb2021. She clarified he would be sweaty and the cold, but nothing extreme. The patient developed muscle aches, body aches, diarrhea, nausea, and vomiting on 09Feb2021. She clarified her husband had fatigue, tiredness, and had trouble with a raspy throat. His raspy throat started Tuesday evening (09Feb2021). His raspy throat felt like he had mucus stuck in his throat, and he was unable to clear the mucus from his throat. The reporter called

No prior vaccinations for this event.

her husband's primary care doctor on the morning of 10Feb2021 because her husband was having trouble with a raspy throat, and difficulty breathing. She said on Tuesday night (09Feb2021) her husband had to sleep sitting up because he couldn't lay down with his breathing. He was able to eat breakfast (clarified as oatmeal and an orange), lunch (clarified as soup and a salad), and dinner (clarified as soup and half a sandwich. She said her husband ate all the meat and half of the bread on the sandwich) on 10Feb2021. Her husband's primary care doctor wasn't available to speak to on Wednesday morning (10Feb2021), but the doctor's nurse said it sounded like her husband was having a reaction to his second COVID-19 Vaccine shot. The reporter said her husband's doctor instructed her later in the day to take her husband to the Emergency Room or Urgent Care if he didn't feel any better. Her husband's throat raspiness got worse in the evening of 10Feb2021. His breathing also became worse after dinner in the evening of 10Feb2021. The patient leaned forward over a couple pillows while sitting on their couch as it was easier for him to breath by doing that. They decided at 11:00PM that her husband should go to the Emergency Room. She said her husband was getting very weak, so she and her husband debated if she should call # for an ambulance, or if she should drive him to the Emergency Room. She said her husband was able to dress himself, but with some difficulty, and she assisted walking him from their house to their car. She said she had turned to walk away from her husband while he was at the side of their car, and then she heard her husband make a noise. He had appeared to have passed out. She clarified in the past, her husband had passed out prior to his pacemaker. She said she dialed #, and the # operator told her how to tell if her husband was still breathing. She said she couldn't tell if her husband was still breathing. She said when the ambulance arrived at her house, the ambulance staff worked on her husband for a long time. The reporter thought her husband had died at the time he had collapsed at the side of their car. The patient took a sugar free cough syrup Tuesday night (09Feb2021), and then again a couple times on Wednesday (10Feb2021) as treatment. The patient had thrown up a couple times, but found that the sugar free cough syrup soothed his cough the night before (09Feb2021). She said her husband had taken 2 TUMS early on Wednesday morning at approximately 2:00AM (10Feb2021). He had said his stomach was bothering him on 10Feb2021. He said he thought he may be constipated, so he took 1 Senokot (Clarified as GeriCare Senna-Plus Natural Vegetable Laxative with Stool Softener) on 10Feb2021. She clarified her husband had diarrhea on 09Feb2021, but felt on 10Feb2021 he may have been constipated. There were no adverse

events required a visit to Emergency Room since Patient's wife stated she was getting her husband to their car, so she could drive him to the Emergency Room, when her husband collapsed and died or to Physician Office as they spoke with the nurse at her husband's primary care doctor's office. Weakness was reported as worsened. The outcome of events Sweaty, Cold, Muscle ache, Body Aches, Fatigue/Tiredness, Raspy throat/worsened, Difficulty breathing, Weakness was not recovered; and of the remaining events was unknown. The patient died on 11Feb2021. The patient's official time of death was Thursday, 11Feb2021, at 12:08AM. Cause of death was unknown. An autopsy was not performed and it would take 3 weeks for a death certificate to be issued. The reporter stated she thought it was important to notify Pfizer of her husband's passing because his side effects fell within the expected time period after receiving his second COVID-19 Vaccine.; Reported Cause(s) of Death: Death

COUGH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

A few days after the vaccination my father had a sore throat and slight cough. This progressed into pneumonia like symptoms and he died on 2/11/21.

No prior vaccinations for this event.

COUGH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Began having SOB and cough on 2/18/21, the day after his first vaccine. Had a routine physician appointment for diabetes on 2/15/21 with no documentation of these complaints. Presented to the hospital on 2/23, soon after required intubation. Admitted with severe pneumonia, diffuse colitis, and sepsis. Condition continued to worsen until patient passed away on 2/24/21 @ 1632.

No prior vaccinations for this event.

COUGH

COVID19 (COVID19 (PFIZER-BIONTECH))

(1200)

Pt admitted to Hospital on 2/8/21 with 2-3 days of SOA and cough. His wife was diagnosed with COVID-19 at approximately the same time when the patient received 1st COVID-19 vaccine. Pt had not felt well since receiving the vaccine and had some changes in taste or smell. He became acutely worse 2-3 days p/t admission with DOE, productive cough, H/A, N/V, profound weakness and bilateral infiltrates on CXR. He was hypoxic on room air. During hospitalization, has gone back and forth from BiPAP to HFNC. Unable to prone. Pt and wife discussed goals of care and decided on comfort measure approach. Pt expired on 2/19/21.

No prior vaccinations for this event.

Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am		No prior vaccinations for this event.

unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

COVID-19	COVID19 (COVID19 (MODERNA)) (1201)
Moderna COVID 19 Vaccine: Patient started with symptoms of covid 5 days after first vaccine. She was hospitalized and passed due to COVID 19 on 2/6/21. Patients family informed us when she was due for the second dose.	No prior vaccinations for this event.

COVID-19	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
COVID-19; COVID-19; Pneumonia; respiratory failure; This is a spontaneous report from a contactable consumer. An 80-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 02Jan2021 for COVID-19 immunization. Medical history included Alzheimer's and others. No known allergies. Concomitant medications included unspecified medications. The reporter's mother in law was tested for COVID-19 at a nursing facility on 25Dec2020 and she was negative. On 02Jan2021, she received the first dose of Pfizer vaccine. On 04Jan2020, she developed a high fever, needed oxygen and was positive for COVID-19. Date of death was 04Jan2021. The cause of her death was listed as pneumonia, respiratory failure and COVID-19. No autopsy performed. No treatment received. No one knew if the vaccination contributed to her death. It was hard to know if her death was due to the administration of the vaccine or it exacerbated the COVID19 symptoms which led to her death. Since this was unknown, it could have been a possibility. The reporter wanted to give us this information because we might want to consider having high risk population, patients with underlying conditions, older population tested for COVID-19 prior to the vaccination, as this is not currently a recommendation or a requirement. All is very new and they are all learning so the reporter wanted to share this information with us. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There are medications the patient received within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The outcome of the events was fatal. Information about Lot/Batch has been requested.; Sender's Comments: The association between the fatal event lack of effect (pneumonia, respiratory failure and COVID-19) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19;	No prior vaccinations for this event.

Pneumonia, respiratory failure and COVID-19

COVID-19	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

COVID-19	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient sent to hospital 1/2 and 1/5. Returned both times to nursing home covid unit without a hospital admission. Resident had been diagnosed with COVID later in the day on 12/30, when routine testing PCR results returned to facility, after resident had already had her first covid vaccination on 12/30/20 in the morning. Resident continued decline, was again sent to hospital on 1/24/21, and expired in hospital 1/25/21.	No prior vaccinations for this event.
COVID-19	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient recevied the COVID-19 vaccine on 1/5/21 by the Vaccine clinic #1. Patient tested positive for COVID-19 by rapid testing on 1/6/21. She demonstrated poor appetite and fluid/food intake and an IV of Normal Saline was initiated on 1/7/21. Oxygen saturation was initiated on 1/12/21 at 4L per nasal cannula. for shortness of breath. On 1/22/21 at 0310 Patient was unresponsive and without vital signs. Orders were for DNR and CPR was not initiated.	No prior vaccinations for this event.

COVID-19	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
TESTED POSITIVE FOR COVID-19 1-7-2021, TRANFERRED TO HOSPITAL ON 1-18-2021. HE READMITTED TO THE FACILITY ON 1-21-2021 WITH HOSPICE SERVICES AND EXPIRED ON 1-25-2021.	No prior vaccinations for this event.

COVID-19	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident was vaccinated on 12/31/20. Then on 1/14/21 he tested positive for SARS-CoV-2 on routine surveillance PCR testing. Another resident on the same hall was COVID positive on 1/11/21. Results of the PCR test were obtained on 1/16/21. He appeared asymptomatic at that time. Given his COVID positive status, all aerosol generating procedures had to be stopped. Overnight on 1/16/21 into 1/17/21, he had the onset of acute respiratory failure and was transported to the hospital. Per notes, he was put on BiPAP for several hours, but his CO2 level did not improve. Per prior advance directives completed with the resident and his two brothers, he had DNR/DNI orders. The hospital physician spoke with his brother and the decision was made to move to comfort care. He was discharged to inpatient hospice and died around 4pm on 1/18/21. This outcome does not appear to be vaccine-related, but death from COVID-19 infection is listed as a reportable event following COVID-19 vaccination.	No prior vaccinations for this event.

COVID-19	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up	No prior vaccinations for this event.

revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2 high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and

underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

	COVID-19	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
The same day that the person was vaccinated he started feeling dizzy and had difficulty breathing. He was hospitalized from February 5 to February 23. Patient died in the hospital on February 23, 2021		No prior vaccinations for this event.
	COVID-19 PNEUMONIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient developed Covid pneumonia dx 1/15/21, patient expired No prior vaccinations for this event.		
COVID-19 PNEUMONIA	**COVID19 (COVID19 (MODERNA)) (1201)**	
Patient was hospitalized on 31 Jan for COVID pneumonia after 3 days of increasing baseline supplemental O2 requirements and dyspnea and ultimately died on comfort care on 3 Feb 2021.		No prior vaccinations for this event.
	COVID-19 PNEUMONIA	**COVID19 (COVID19**

	(MODERNA)) (1201)
Patient was vaccinated on 1/14/2021. On 1/22/2021, patient tested positive for COVID-19 and admitted to the hospital for acute hypoxemic respiratory failure, COVID-19 pneumonia, and severe ARDS. Patient was intubated on 1/23/2021 and later died on 2/10/2021 after being extubated and placed on comfort measures.	No prior vaccinations for this event.
COVID-19 PNEUMONIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due	No prior vaccinations for this event.

to Covid 19 pneumonia.

	COVID-19 PNEUMONIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Per family, patient has been feeling sick since he was vaccinated, patient went to ER on 02/15/2021, and after few hours at ER patient passed away.		No prior vaccinations for this event.

	COVID-19 PNEUMONIA	**COVID19 (COVID19 (MODERNA)) (1201)**
Started feeling unwell; Headaches; Body aches; Chest pain; Didn't had wishes to eat; Diarrhea; COVID-19 pneumonia; A spontaneous report was received from a consumer concerning a 69-year-old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced COVID-19 pneumonia, feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea The patient's medical history high blood pressure which was controlled with medication. Concomitant product use included nifedipine and fenofibrate. On 20-JAN-2021, approximately a week and a half or two prior to the onset of the symptoms, the patient received their first of two planned doses of mRNA-1273 (Batch number 030L20A) intramuscularly in the right arm for prophylaxis of COVID-19 infection. A week and a half or two later the patient stated feeling unwell, headaches, body aches, chest pain, decreased appetite and diarrhea for which patient was hospitalized on 06-FEB-2021. Since everything seemed to be fine the patient was discharged on an unknown date in FEB-2021 however, patient's family was not notified that it was a late reaction to the vaccine's first dose. Later, due to shortness of breath he was hospitalized again on 08-FEB-2021 and was diagnosed for pneumonia and was intubated on the same day. Due to COVID-19 situation patient's family could not be in the facilities and that there wasn't any follow up of the patient given to the family, so family did not have much information. During the first hospitalization(06-FEB-2021) the patient had a blood test which showed a normal result and was tested for COVID-19 and Influenza, both were negative. During second hospitalization (08-FEB-2021) the hospital said that the patient was stable. The patient's family did not know the results of the tests conducted at		No prior vaccinations for this event.

the time. The action taken with the vaccine in response to the events is not applicable. The outcome of COVID-19 pneumonia was fatal. The patient died on 14 Feb 2021 The cause of death was reported as COVID-19 related pneumonia. The autopsy was not done.; Reporter's Comments: Very limited information regarding this event has been provided at this time. The cause of death was reported as COVID-19 related pneumonia. Based on the current available information and the mechanism of action of mRNA-1237 vaccine, the events are assessed as unlikely related. Further information has been requested.; Reported Cause(s) of Death: COVID-19 pneumonia

(1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

COVID-19 PNEUMONIA	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she	No prior vaccinations for this event.

contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased		
CRANIOCEREBRAL INJURY		**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine given in clinic per protocol - patient monitored for 15 minutes, no adverse reactions noted at the time. Patient stated he felt fine following 15 minute monitoring time. Patient left facility- it was later reported that pt had a fall at home. Upon review of pt's medical record - Pt's wife had to initiate CPR and call EMS for transportation and life saving measures enroute to the Emergency Room. Pt was intubated as pt was in asystole upon arrival to the ER, ACLS was continued, pt was noted to have a traumatic brain injury from his fall at home, and pt was pronounced dead at 1620.		No prior vaccinations for this event.
CRANIOCEREBRAL INJURY		**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"death Narrative: 92 yo male seen in clinic on 12/30/2020 for transfusion, hbg 6.9. PMH includes HLD, CKD, myelodysplastic syndrome, DM, prostate cancer, HTN. Pt also received COVID19 Pfizer vaccine the		No prior vaccinations for this event.

same day. The patient denied any prior severereaction to this vaccine or its components. Post-transfusion, patient had a mechanical fall (per patient he was seated and used the cane to help him stand. However the cane slipped on the floor causing the patient to fall, patient hit his head and injured his right hip, no loss of consciousness at the time). Rapid response team was called and patient was admitted to the ED. Pt was found to have subcapital right femoral neck fracture, scalp contusion, and TBI (per ED provider's note). Ortho evaluated and said patient wasn't a surgical candidate. During his hospitalization, patient tested positive for COVID19 on 1/12/2021, pt was asymptomatic at the time. On 1/13/2021, pt exhibited mild URI symptoms, no respiratory distress. He was started on cetirizine, Montelukast, albuterol, and inhaled steroids to manage his symptoms. Dexamethasone was started on 1/14/2021. Chest Xray was ordered on 1/17/2021, pt's respiratory was slowly getting worse, resting O2 sats were in the high 80s and low 90s with IS. On 1/18/2021, CXR shows patchy bilateral airspace opacities suspious for pneumonia of bacterial or viral etiology. Pt was started on remdesivir 01/18/2021 (5 doses, from 1/18-1/22/2021). Pt required 5-6 LPM of oxygen at rest. Pt was then transferred to the ICU. His oxygen demand continued to increase and his condition worsened. On 2/14/2021, pt started to desat into the 70s on max high flow. Patient/family agree to comfort care. Medical cause of death was listed as ""acute hypoxic respiratory failure due to COVID19."" Patient expired 1/24/2021."

CRANIOTOMY	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Initial pain in back of head and extreme headache. Some vomiting. At emergency, went into coma and was intubated. Hole drilled in skull to relieve pressure. MRI taken. Lot of bleeding in brain - anuerism lead to death approximately 14 hours after initial symptoms.	No prior vaccinations for this event.
CREATINE URINE INCREASED	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right

No prior vaccinations for this event.

middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

CREPITATIONS	**COVID19 (COVID19 (MODERNA)) (1201)**
Pt received second dose of COVID vaccine on 01/20/2021 at 1430. At 1600 Pt developed a wet productive cough with coarse crackles. Pt ate dinner at 5 pm cough persisted. At 18:30 the nurse went to Pt's room to give him his medications. Pt still had a cough, denied shortness of breath. Pt was in a good mood and joking with staff. Pt asked to be shaved. At 19:45 Pt was sitting in the lounge and a CNA noticed that Pt was pale/white in color and clammy. 02 Sat was 85%. Respirations were labored. Pt was placed on 4 L of 02. Increased to 5 L via face mask and 02 sat was 89-90%. Ambulance was called at unknown time. Pt arrived at Medical Center at 2120 and was pronounced dead at 2127.	No prior vaccinations for this event.

CREPITATIONS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident received 1st dose on 1/4/2021. On 1/6/2021 resident having SOB, increased weakness with O2 sats at 91% RA. On 8th resident sustained a fall, O2 sats 88-92, dizzy, weakness. Rapid COVID test performed with negative results. Evening of 8th resident was lethargic and diaphoretic with fever of 99.9.	Influenza Virus Vaccines - Unknown date/type or brand

Resident transferred to ER, on 5lt of oxygen. Resident returned from the ER on 1/9/2021 with new diagnosis of Leukemia and orders for hospice. Continued with fever, crackles and N/V and loss of appetite from the 9th and 10th of January. Resident expired at 820am on 1/11/2021.

CREPITATIONS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
He started vomiting 2 days later. we suspect he was having stool issues as well. he vomited blood at some point over the weekend. there was black vomit right before he passed. from 2am-6am he was wheezing and rattling and then he passed at approximately 6am 3/1/2021 at home. EMS did come and try to revive him and were unsuccessful.	No prior vaccinations for this event.
CRYSTAL URINE ABSENT	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency	No prior vaccinations for this event.

room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

CRYSTAL URINE PRESENT

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to

No prior vaccinations for this event.

make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

chest x-ray shows numerous bilateral patchy opacities; catastrophic brain bleed; Brainstem reflexes were lost; Patient died; shortness of breath; nausea; diarrhea; worsening shortness of breath/numerous bilateral patchy opacities; immunosuppressed status; This is a spontaneous report from a contactable pharmacist and a contactable other health professional. A 61-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL9261), intramuscular at arm right on 28Jan2021 (at the age of 61 years) at single dose for COVID-19 immunization. The patient medical history included bilateral lung transplant on 23Jun2017, lymphangioleiomyomatosis, hepatocellular carcinoma, antibody mediated rejection of lung transplant , bronchiolitis obliterans syndrome, grade 0P, major depressive disorder, RLS (restless legs syndrome), chronic insomnia, long term current use of systemic		No prior vaccinations for this event.

steroids OSA (obstructive sleep apnea), iron deficiency anemia, bilateral sciatica, hoarseness of voice, memory change, laryngeal stridor, pure hypercholesterolemia senile nuclear cataract, bilateral myopia of both eyes, osteoporosis without current pathological fracture, alopecia, immunosuppressed status, all from an unknown date and unknown if ongoing. Concomitant medication included acyclovir (formulation: capsule, strength: 200 mg) oral at 200 mg twice daily, salbutamol (ALBUTEROL HFA) as needed (MCG/ACT inhaler take 2 puffs by inhalation every 4 hours as needed) for wheezing (shortness of breath), atorvastatin (LIPITOR, formulation: tablet) oral at 80 mg once a day, azithromycin (ZITHROMAX, formulation: tablet)oral at 250 mg (every Monday, Wednesday, Friday), bupropion hydrochloride (WELLBUTRIN XL, formulation: tablet, strength: 150 mg) oral at 150 mg once a day, calcium citrate/cholecalciferol (CALCIUM + VITAMIN D, formulation: tablet) oral at 2 dose form once a day (every morning), everolimus (ZORTRESS, formulation: tablet, strength: 1 mg) oral at 2 mg twice a day, fluticasone propionate/salmeterol xinafoate (ADVAIR, strength: 500 ug/ 20 ug) twice daily (1 puff by inhalation), gabapentin (NEURONTIN, formulation: capsule, strength:100 mg) oral at 300 mg daily (by mouth nightly), loratadine (CLARITIN, formulation: tablet, strength: 10 mg) oral at 10 mg as needed, metoprolol tartrate (LOPRESSOR, formulation: tablet, strength: 25 mg)oral at 50 mg twice daily, minoxidil (ROGAN, strength: 5%) topical apply 1 cap full every other day to affected area on scalp for alopecia, ondansetron (ZOFRAN, formulation: tablet, strength: 4 mg) oral at 4 mg as needed for nausea, pantoprazole sodium sesquihydrate (PROTONIX, formulation: tablet, strength: 40 mg) oral at 40 mg once a day, prednisone (DELTASONE, formulation: tablet, strength: 5 mg) oral at 5 mg daily (every morning), sertraline hydrochloride (ZOLOFT, formulation: tablet, strength: 100 mg) oral at 100 mg twice a day (every morning), sulfamethoxazole/trimethoprim (BACTRIM) 400-80 mg per tablet (1 tablet by mouth every Monday, Wednesday, Friday), tacrolimus (formulation: capsule) at 3 mg daily (2 mg every morning and 1 mg at night), salbutamol sulfate (PROVENTIL HFA) as needed for wheezing (shortness of breath), salbutamol sulfate (VENTOLIN HFA) as needed for wheezing (shortness of breath) , salbutamol sulfate (PROAIR HFA) as needed for wheezing (shortness of breath), ascorbic acid/ferrous fumarate/folic acid/ retinol (PRENATAL, formulation: tablet) oral daily. The patient previously took NSAIDs and voriconazole and experienced drug allergies. It was reported that the patient presented to emergency department (ED) on 04Feb2021 with chief complaint of worsening shortness of breath, nausea and diarrhea for past week since receiving since receiving COVID-19 vaccine. Full viral panel including COVID-19 was not

detected. All blood cultures and respiratory cultures were negative. Patient chest x-ray shows numerous bilateral patchy opacities which is significantly different from her previous chest x-ray here. Empiric rejection treatment initiated including high dose methylprednisolone, plasmapheresis, IVIG, thymoglobulin. She continued to decline and ultimately required intubation, proning and paralyzing on 08Feb2021 and then VV ECMO cannulation on 13Feb2021. Acute pupil exam changes in the early am hours of 15Feb2021 prompted urgent head CT which revealed catastrophic brain bleed. Brainstem reflexes were lost soon after. Despite placing an EVD emergently at bedside, brain stem reflexes were not recovered. The events were all serious. The patient outcome of the events was fatal. The patient died on 15Feb2021. It was not reported if an autopsy was performed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported event may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Chest x-ray shows numerous bilateral patchy opacities; Catastrophic brain bleed; Brainstem reflexes were lost; shortness of breath; nausea; Diarrhea; Worsening shortness of breath/numerous bilateral patchy opacities

CULTURE NEGATIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
resident expired; This is a spontaneous report from a contactable healthcare professional. An 82-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot	No prior vaccinations for

number: EL0140), intramuscular in the left arm on 05Jan2021 15:00 at a single dose for COVID-19 immunization. Medical history included metabolic encephalopathy from, failure to thrive (FTT), diabetes mellitus (DM) 2 , chronic obstructive pulmonary disease (COPD), arthritis, weakness, hyperlipidemia, chronic kidney disease (CKD), dementia. Known allergies was none. The patient took unspecified concomitant medication. On 11Jan2021, the resident expired. The patient underwent lab tests and procedures which included nasal swab: negative on 09Jan2021. There was no treatment given for the event. The patient died on 11Jan2021. An autopsy was not performed.; Sender's Comments: Lacking information on the cause of patient's demise, the Company cannot completely exclude a causal relationship between COVID 19 vaccine, BNT162B2, and patient's death of unknown cause, as a cautionary measure and for reporting purposes. The patient's pre-existing medical condition of metabolic encephalopathy from, failure to thrive (FTT), diabetes mellitus (DM) 2 , chronic obstructive pulmonary disease (COPD), arthritis, weakness, hyperlipidemia, chronic kidney disease (CKD), dementia may have provided the contribution to the event in this 82-year-old male patient. The impacts of this report on the benefit/risk profile of the product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Emergency room 1/11/21 Patient is a 72 year old female who presents with decreased level of consciousness. The patient is a nursing home patient and had an episode of choking yesterday that was treated with a Heimlich maneuver. Nursing staff at the nursing home reports that she seems to be a bit less responsive today. However, the patient has been for the most part unresponsive for 3-4 months time following a COVID-19 infection. Of note, her oxygen saturation on room air is 72%. The patient is also febrile to 100.8¦. She was unable to provide any information and the aforementioned information is gathered from nursing home staff report.	No prior vaccinations for this event.

CULTURE URINE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Emergency Room HPI: The patient is a 71 y.o. female with a PMH notable for COPD, hypertension and anxiety and depression who presented on 2/6/2021 for evaluation of shortness of breath. Patient presented to our emergency room yesterday morning from local nursing facility rehab nursing staff reported that she had had a increased shortness of breath for the last 3 days she has been diagnosed with COVID-19 on 2-2-2021. Patient has also received both COVID-19 vaccines. Patient presented to the emergency room with labored	No prior vaccinations for this event.

respirations conscious awake and was on a non-rebreather at 15 L. upon arrival to our emergency room patient's temperature 101.6¦, pulse 169, respirations 40 to blood pressure 142/91 and oxygen saturation 100% on 15 L non-rebreather. Patient received a chest x-ray that showed chronic emphysema and fibrotic changes in the lung no acute processes identified. Patient's white count 12.8, glucose 197, creatinine 1.2, lactic acid 4.6, cardiac enzymes negative, D-dimer 1180, patient has urine culture pending. Patient has received about 3 L normal saline boluses patient was having hypotension 86/52. Patient also received IV acetaminophen a 1000 mg IV in the emergency room along with Decadron 10 mg IV piggyback. Patient was admitted acute care for the need of IV fluids and IV antibiotics for COVID-19 and sepsis 2/12 admit Brief history and initial physical exam: Patient is a 71 year old long-term resident of Rehab and Healthcare. Unfortunately, she contracted coronavirus (COVID-19) at the nursing home. Her respiratory status started to decompensate and so she was brought into the hospital. Initial workup showed significant bilateral pleural effusions and ground-glass opacity of both lungs. She had a significant supplemental oxygen requirement. She was admitted for further evaluation and treatment. á Hospital course: The patient was admitted and started on IV Remdesivir. She was given IV Decadron. She was given immune support vitamins. Despite this, her sepsis worsened. When it became apparent that the patient was not going to recover, her daughter did make her comfort care only and hospice was consulted. The patient was found to be appropriate for general inpatient hospice and was made comfort care. Her requirement for morphine and Ativan did slowly rise. Eventually, the patient did succumb to her respiratory failure. Time of death was called at 10:00 p.m. on February 15, 2021 á Discharge Condition: expired. Presume cause of death with cardiopulmonary arrest secondary to acute respiratory failure secondary to coronavirus (COVID-19) pneumonia á Disposition: Deceased

"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19	No prior vaccinations for this event.

vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"

CULTURE URINE POSITIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
1 fall after first dose on 1/8/2021 at 1930; no injuries; 4 falls after second dose on 1/14/21 at 1545, 1/15/21 at 1700, 1/21/21/at 1220 and 1/21/21 at 1330 all falls with no injuries. Started Ceftriaxone 1 GM IM daily for 5 dyas on 1/21/21 for UTI: E. Coli	No prior vaccinations for this event.

CULTURE URINE POSITIVE	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
2/12/2021 Vaccine 2/13/2021 Weakness, oral ulcers 2/17/2021 Brought to ER for loss of consciousness, altered mental status, rectal bleeding; work up showed sepsis, UTI, anemia, pneumonia, pleural effusion, pancytopenia, hypotension; persistent hypotension and respiratory failure 2/18/2021 Passed away at 5:54AM	No prior vaccinations for this event.

CULTURE WOUND NEGATIVE	**COVID19 (COVID19 (MODERNA)) (1201)**
Vaccine manufacturer and lot number unknown, vaccine given at alternate location. 2/23/21 8:27 PM: The patient is a 68-year-old male comes to the emergency department by paramedic ambulance for altered mental status that, began at around noon in association fever temp 102.9. PMH of myelofibrosis (on Jakafi and hydroxychloroquine), depression, anxiety, OSA, and history of AVR. Given history of myelodysplasia and Jak inhibitor predisposing to some opportunistic infections most notably viral reactivation with history of HSV and possible bacterial endocarditis he was admitted to the ICU for further monitoring and pressors. Patient has a MOS procedure 14 days prior - Status post MOSs procedure with large wound deficit on forehead -- Does not appear to be overtly infected at the time of admission. ED physician indicated mild facial cellulitis. 2/23/21-	No prior vaccinations for this event.

WBC 16.1 on admission. ECHO 2/26 indicated - no vegetation visualized. Of note second COVID vaccine 2 days prior to admission. Dr. felt incident was possible cardiogenic shock secondary to COVID vaccine. He did not feel the patient has a source of infection upon admission. Questionable given wounds on forehead Dr. (CMO) review of case- his impression was septic shock with and underlying case of chronic cardiac compromise making the hemodynamics worse

	CYANOSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
UNKNOWN/ASYTOLE Narrative: Please refer to section 6. 68y/o male with h/o severe peripheral vascular disease with previous left AKA 2/3/20, s/p bilateral bypasses in the past. Pt recently underwent right AKA on 1/12/21. Per Hospital remote data 1/10/21 pt c/o shortness of breath, CXR demonstrated right lower lobe opacity & left basilar infiltrate. Pt s/p >10 days emperic IV abx. Moderna vaccine 0.5ml IM was administered via left deltoid on 1/22/21 around 16:21. On 1/23/21@05:14 code blue was called as pt found to be unresponsive, breathless and pulseless, facial cyanosis noted, CPR started immediately.Pt found to be in asystole. ACLS guideline followed but no return of spontaneous circulation, At 05:32 pt remained pulseless and breathless and was pronounced. Autopsy currently pending.		No prior vaccinations for this event.

	CYANOSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
The patient went home around 11 am on 1-31-21 after her vaccine and 15 minute observation period. She was eating breakfast after at home and complained to a neighbor that her teeth hurt and she was nauseated after eating. In the afternoon, she felt dizzy and had diarrhea accompanied with blood. Close to 9 PM, her son went to check on her. The patient was found on the floor--she was unresponsive and had purple lips. Her son called an ambulance and started chest compressions. The patient passed away at the hospital. The doctor has ordered an autopsy, and the results are pending.		No prior vaccinations for this event.

CYANOSIS		**COVID19 (COVID19 (MODERNA)) (1201)**
Admitted to hospital with sob upon exertion that started prior to vaccine. Hx COPD, HTN, CKD, hyperlipidemia, bladder cancer in remission. Stated he has been taking Eliquis and Xarelto between renal doctor and cardiologist Dr. Anticipating going home 2/5/21 but then turned blue and stopped breathing under a DNR. COVID test negative. Labs show acute on chronic renal failure with an elevated troponin likely from demand ischemia.		No prior vaccinations for this event.
CYANOSIS		**COVID19 (COVID19 (MODERNA)) (1201)**
Patient had no reaction at the clinic. Patient is a medical doctor whose partner called in this death. States patient had no complaint on 1/13 nor 1/14 while at work. States patient died at home on 1/15 a.m. Physician who stated she was called to the patient's home @ 0157 1/15/2021 and found cyanotic from head to toe. State girlfriend found him sitting in the chair a few minutes before they called her. The Coroner did not order autopsy. Did not sent patient to the hospital. Sent him directly Funeral Home. Death Certificate Number 123-2021-002593 list cause of death as pending. I spoke with the patient's primary doctor who gave me the history of HTN, Diabetes, & High Cholesterol. States he had not seen this patient since April 2020. They were also friends and he was not aware of any medical problems. The Coroner state she thinks patient has a heart attack. Neither the Coroner nor PMD think death was related to COVID Vaccine. Informed both that MSDH would have to complete VAERS. Both voiced understanding.		No prior vaccinations for this event.
CYANOSIS		**COVID19 (COVID19 (MODERNA)) (1201)**
Received vaccine on 2/6/2021. was a bit off all week per caregivers - low grade temp and reporting pain which they treated with Tylenol. She was pretty much herself on morning of 2/13/2021 - got up, had shower. caregivers noted her extremities were cool and face was red. temp was 97.4. She was placed in wheelchair		No prior vaccinations for this event.

with book in the living room. caregivers noted she was not turning pages of the book as she usually would. She was tracking, so they don't think she had a seizure. Caregiver moved her back to bed with blanket and noted that her lips were blue and at that point called 911. She was found with agonal breathing, CPR started, intubated by EMS, taken to the ER and diagnosed with cardiac arrest upon arrival. CPR was continued until family could be reached and decision was made to stop resuscitation.

CYANOSIS	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient discovered unresponsive in cell, blue coloration to skin, vital signs, undetectable. CPR initiated, Ambulance summoned. Following EMS arrival with additional unsuccessful attempts to revive patient, patient was determined to have expired.	No prior vaccinations for this event.
CYANOSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Had no immediate issues with the vaccine. He had returned from the hospital on 12/21 and had some concerns about his weight which were shared with his physician on 1/4/21. On 1/5/21 had a visit with his cardiologist for a pacemaker check. On 1/8/21 staff were called to his room, he was on the floor, bluish skin color. No vital signs found, no heart rhythm heard at 2200.	No prior vaccinations for this event.
CYANOSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient received COVID 19 vaccine the morning of 1/18/21 at Public Health COVID-19 vaccine clinic. I (person completing this report) work for PH. Later that night while in bed, patient reported difficulty breathing to his wife, then turned blue, and became unresponsive. Family report pt was without any	No prior vaccinations for this event.

symptoms prior to event. 911 called; CPR started by family member 15 min. after pt became unresponsive. EMS performed resuscitation for about 30-40 minutes with multiple defibrillation for V-fib. Between EMS and Medical Center ER, pt had 9 rounds of epi, CPR w/ LUCAS machine, given 2 doses of amiodarone (150 mg and 300 mg). Patient had 3 EKGs, which did not show STEMI, but did show nonspecific conduction delay and sinus arrest with junctional escape vs sinus bradycardia (HR 50's). Pt had return of spontaneous circulation. Pt intubated, and started on Levophed. Pt transferred to ICU, and had central line placed. Family decided to make patient DNR. Pt went into coarse VFib again, and as per wishes of family, code blue not called. Patient expired at 01:53 on 1/19/21.

CYANOSIS

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

1/27/21 Emergency room: HPI Patient is a 77 y.o. male who presents after a syncopal episode with cyanosis and shortness of breath. Patient came from rehab where they stated he was sitting on his bed, his oxygen saturation dropped down to 76% on 4L and he became cyanotic. By the time EMS arrived, patient was back to 95% on 4 L. On arrival to the ER, he is 98-100% on 4L. He has a history of COPD and has a chronic cough due to this.Currently, he has no pain, no shortness of breath, no weakness, no cyanosis. He is afebrile and sitting comfortably in bed. 2/10/21 emergency room HPI Patient is a 77 y.o. male who presents with in full cardiac arrest. Patient is resident of local nursing home. According to nursing home staff, a tech was in his room talking with him as patient was laying in bed. Tech began walking out of patient's room and turned around to tell him one last thing when the tech noticed patient had gone unresponsive. Patient had no spontaneous respirations or pulse, subsequently CPR was started immediately. 911 was called. This occurred around 5:30 a.m.. á Upon EMS arrival on scene, they found a male unresponsive with CPR being performed. There was no spontaneous respirations or circulation. Thus, ET tube was placed and life support guidelines initiated. Patient was found to be in PEA, and according to EMS, patient was given a total of 6, 1 mg epinephrine IV push and 1, 1 Amp sodium bicarb. Patient was worked on at the scene for approximately 40 min before being transferred to ER. á Upon arrival to ER

No prior vaccinations for this event.

trauma room 1 patient is still in full arrest. ET tube in place with good ventilation. Patient remains in PEA. Chest compressions and life support guidelines initiated. á In reviewing patient's chart and nursing home notes, patient is a full code. Patient has a significant cardiac history including known coronary artery disease with 4 vessel CABG. Patient also has history of 3rd degree heart block and pacemaker placement. Patient has history of ischemic cardiomyopathy but last echo performed in 2020 shows ejection fraction of 45%.

CYANOSIS	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Hospital course 1/31 ? 2/20/21 1/31 in ED pt was at home when children noticed his lips were blue, ems arrived and found him to be 50% on RA, on Non-rebreather pt got to 78%, covid on 01/26 Shortness of Breath 61-year-old male presents with EMS for evaluation of shortness of breath hypoxia. History is limited due to the patient's current clinical condition and so is primarily obtained from EMS. EMS reports that he tested positive for COVID-19 5 days ago. He began developing shortness of breath yesterday and his family called because his lips and fingers were blue today and he appeared short of breath. On EMS arrival he had a room air saturation of less than 50% so he was placed on nonrebreather with improvement in his saturation to 70% and he was transported to the emergency department. Patient does admit to shortness of breath. He denies any chest pain. He is noted to have a cast on his left ankle and said that he broke his left ankle on 23 December but has not had surgery. He denies any new pain or swelling of the leg. In the ED he was placed on 15L nasal cannula and NRB mask with improvement in SPO2 to low 90s. Additional work up revealed troponin of 1.35, lactic acid 5.8, and d-dimer 14.4. He received dexamethasone and was placed on heparin gtt. 1/31 admitted to ICU Acute hypoxic respiratory failure due to COVID-19 vs heart failure vs PE. CXR with bilateral hazy infiltrates more pronounced in the bases and left periphery and suspected multifocal pneumonia. At risk for PE given LLE immobility in the setting of COVID-19 with significantly elevated d-dimer. RISK of CTA outweighs benefit given AKI and iodine allergy. Continue with empiric treatment with heparin gtt. Admitted to ICU with SO2 in 60s-70s on 15L and NRB. Attempted 50L 95% FIO2	No prior vaccinations for this event.

high flow and nasal cannula. Given lasix 40mg IV with good diuresis however SPO2 still remained low 80s with RR 40s and PO2 42 so the decision was made to intubate. Oxygenation improved following intubation, with further improvement following recruitment maneuver and increase in PEEP. FIO2 weaned to 90% with SPO2 remaining in mid 90s. Will continue to wean FIO2 as able. ARDS net protocol as much as possible. Consider prone ventilation and/or epoprostenol if unable to improve . VAP Bundle: HOB >30 degrees; Oral care per nursing standard and on DVT/PPI prophylaxis Sedation: Target Richmond Agitation and Sedation Scale (RASS) of 0 to -2 with propofol and fentanyl. Check baseline TG levels. COVID - 19: Convalescent plasma: Not indicated Steroids: Dexamethasone 6 mg / day for 10 days Remdesivir: Not indicated d/t AKI IL-6 inhibitor: Meets criteria for tocilizumab Systemic AC: Heparin gtt. No signs of bleeding (Platelets and Hb stable). Antibiotics: Start 3 and 7 day course of azithromycin and ceftriaxone, respectively. Elevated troponin Suspect demand ischemia d/t hypoxia; EKG does not show any ischemic changes AKI: Suspect d/t hypoxia in the setting of COVID infection. Urine output and electrolytes acceptable. Closed fracture of left ankle Suffered fracture following a fall on ice in December. Cast was placed on 12/30 by SOS. He was due to be re-evaluated this week for possible cast removal. Inhaled epoprostenol started Considered for ECMO but not initiated due to not a candidate Vasopressors required at times Antihypertensive infusion required at times severe hypoxia with position changes switched from heparin drip to enoxaparin prophylaxis 2/20 discharge summary 61 y/o male admitted to Hospital on 1/31 with hypoxia. He was diagnosed with COVID 19 5 days prior to admission, and had worsening respiratory status. He was intubated after arrival, and was on ventilator for the entire intervening time, until he was extubated on 2/20 at the time of transition to Comfort measures only. Prior to developing COVID 19, he had received his first dose of the Pfizer vaccine, as a member of the school system. He had a fractured L ankle after a fall on 12/31/20, and had a cast in place at the time of admission. He received Tocilizumab on 1/31, and underwent several cycles of prone positioning, beginning on 2/2. He completed a course of Decadron, he received Ceftriaxone and azithromycin beginning on admission, and completed a course of these. Anticoagulation with enoxaparin was utilized due to coagulopathy associated with COVID 19. Vasopressor support was required at times, as well as diuresis for fluid management. He required high levels of sedation to maintain ventilator synchrony, and high levels of ventilator support with high oxygen levels throughout his stay. Tracheostomy was being considered, but family decided that since he was not going to have good

recovery, withdrawal of support, and allowing death was the appropriate choice for the patient and for them. He was extubated at 2100 on 2/20/2021. Death was pronounced at 2123 on 2/20/2021. Children were at bedside.

CYSTATIN C INCREASED	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"	No prior vaccinations for this event.

CYTOKINE RELEASE SYNDROME	COVID19 (COVID19 (MODERNA)) (1201)
Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.	No prior vaccinations for this event.

DEATH	COVID19 (COVID19 (MODERNA)) (1201)
Patient had mild hypotension, decreased oral intake, somnolence starting 3 days after vaccination and	No prior vaccinations for

death 5 days after administration. He did have advanced dementia and was hospice eligible based on history of aspiration pneumonia. this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

My grandmother died a few hours after receiving the moderna covid vaccine booster 1. While I don?t expect that the events are related, the treating hospital did not acknowledge this and I wanted to be sure a report was made. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Resident in our long term care facility who received first dose of Moderna COVID-19 Vaccine on 12/22/2020, only documented side effect was mild fatigue after receiving. She passed away on 12/27/2020 of natural causes per report. Has previously been in & out of hospice care, resided in nursing home for 9+ years, elderly with dementia. Due to proximity of vaccination we felt we should report the death, even though it is not believed to be related. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Patient died within 12 hours of receiving the vaccine. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

After vaccination, patient tested positive for COVID-19. Patient was very ill and had numerous chronic health issues prior to vaccination. Facility had a number of patients who had already tested positive for COVID-19. Vaccination continued in an effort to prevent this patient from contracting the virus or to mitigate his risk. This No prior vaccinations for this event.

was unsuccessful and patient died.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

At the time of vaccination, there was an outbreak of residents who had already tested positive for COVID 19 at the nursing home where patient was a resident. About a week later, patient tested positive for COVID 19. She had a number of chronic, underlying health conditions. The vaccine did not have enough time to prevent COVID 19. There is no evidence that the vaccination caused patient's death. It simply didn't have time to save her life. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Prior to the administration of the COVID 19 vaccine, the nursing home had an outbreak of COVID-19. Patient was vaccinated and about a week later she tested positive for COVID-19. She had underlying thyroid and diabetes disease. She died as a result of COVID-19 and her underlying health conditions and not as a result of the vaccine. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

1/1/2020: Residents was found unresponsive. Pronounced deceased at 6:02pm No prior vaccinations for this event.

"1-2-2021 10:30 PM Complained Right arm/back hurt - took Tylenol 1-3-2021 Complained Right arm hurt, dizzy 1-4-2021 Felt better - did laundry, daughter found her deceased at 3:30 pm. Dr. at hospital said it was ""cardiac event"" according to death certificate."	No prior vaccinations for this event.
DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
Staff reported that patient was found Friday morning (Jan 8) sitting at a table with his head tilted forward and unresponsive to verbal or physical stimuli. Staff lowered patient to floor and started CPR. EMS was called and continued CPR at scene, however they were not able to revive patient. Patient was pronounced dead at the scene. Staff written statements following the death of patient show that he had a fall about 1 hr. prior. It is unknown if this fall contributed to patient's death. An autopsy has been requested.	No prior vaccinations for this event.
DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
The resident resides in an independent living facility/apartment. The reporter at the center was informed by his daughter he was not feeling well on 1/1/2021 (specific symptoms could not be ascertained). He reportedly went to be COVID tested on 1/1/2020 and observed to be deceased in his apartment on 1/2/2020. I do not have confirmation of his COVID results, although the reporter indicates his daughter reports his test was positive.	No prior vaccinations for this event.
DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
Patient received COVID-19 (Moderna) vaccine from the Health Department on afternoon of January 8, 2021 and went to sleep approximately 2300 that night. Was found unresponsive in bed the following morning and	No prior vaccinations for

pronounced dead at 1336 on January 9, 2021		this event.

COVID19 (COVID19 (MODERNA)) (1201)

Resident had lunch on 01/14/21 and after lunch around 2:00pm, he vomited and stopped breathing. We coded the resident and 911 paramedics came. They pronounced him dead at 2:18pm.

No prior vaccinations for this event.

DEATH		**COVID19 (COVID19 (MODERNA)) (1201)**
Around 00:50am on 01/15/21, C.N.A. reported that the resident looked different and not responding. Initiated Code Blue and started CPR. 911 arrived and pronounced resident dead at 1:01 am.		No prior vaccinations for this event.
DEATH		**COVID19 (COVID19 (MODERNA)) (1201)**
This patient has been under hospice care for over 2 years at the nursing home. She has had a steady decline with gradual weight loss. She was totally dependent in her care needs. She received the vaccine on 1/2/2021 as part of the facility vaccination campaign. No adverse events noted initially. On 1/3/2021 at 6:06 pm, she was noted on vital sign checks (done every 4 hours for first 72 hours after vaccination) with BP 64/52 but otherwise asymptomatic. Subsequent BP improved. On 1/4/2021 at 4:45 am, pt found with respiratory rate of 30 with otherwise normal vital signs. Tachypnea persisted, so she received liquid morphine 2.5 mg without improvement. Supplemental oxygen was applied. Tachypnea persisted. She had poor oral intake after that point had persistent tachypnea and worsening hypoxemia despite clear lungs on exam. She remained under hospice care and comfort measures were continued. No blood testing or imaging tests were done. She required increasing amounts of oxygen, became hypotensive, and died peacefully on 1/8/2021 at 7:45 pm.		No prior vaccinations for this event.
DEATH		**COVID19 (COVID19 (MODERNA)) (1201)**
"On 1/15/2021 at 1800, resident noted to be lethargic and shaking, stating ""I don't care."" repeatedly. C/O head and neck pain. T100.6. Given Tylenol with no relief of pain. Order received for Aleve and administered.. Assisted to bed as usual in evening. Monitored during night shift and noted to be resting comfortably/sleeping.. Noted agonal breathing at 4:10 AM 1/16/2021 , T 99.4, Absence of vital signs at 4:15AM 1/16/21 and death pronounced at 4:40AM 1/16/21."		No prior vaccinations for this event.

COVID19 (COVID19 (MODERNA)) (1201)

"Narrative: Patient with severe aphasia and only able to say ""hey, hey, hey"" or ""uh huh"" or shake his head no as a way to communicate. Patient previously able to ambulate with significant limp and hyperextension of right knee, but mostly wheelchair bound over last several years as he had had a slow and steady decline in overall health and mobility. Patient developed aggressive behavior of shouting ""hey"" and grabbing of groin in 2016. This was worked up with CT scans, labs, referral to urology, neurology, and referrals to psychiatry. The exact etiology of this action was never able to be affirmed, but thought to be more psychiatrically related. It improved significantly with addition of antipsychotics, worsened when antipsychotics were reduced, and improved again with addition of injectable antipsychotic on 12-10-2020.Patient suffered from falls on occasion given his significantly impaired physical mobility. His last documented fall was 8-31-2019. Patient began utilizing wheelchair most of time following that fall. No significant injuries noted in documentation of the falls. In the last 3 months, patient would often refuse medications. He would sometimes indicate that they would cause dizziness, and other times he would simply refuse. We attempted to hide medications in his food/fluid (with wife's blessing) and when he detected this he would occasionally refuse to eat. Patient previously on

No prior vaccinations for this event.

DOAC. After pharmacy review in 12/2020 it was recommended to discontinue this as no clear indication to continue use. He was high fall risk and would often refuse this medication as well since 10/2020. Noted to be in NSR on EKGs and decision made to discontinue the DOAC. Patient had no evidence of adverse effects noted after vaccination on December 28th. Patient seen by provider on the morning of his death (1/4/2021) with no noticeable significant change in health condition. Temperature 36.8Con January 4th at 19:45. During routine bedtime cares, patient suddenly collapsed and death was pronounced January 4, 2021 at 20:05. Autopsy was requested from next of kin and no autopsy was granted. Symptoms: & DEATH Treatment:"

serious allergic reactions. She tolerated the vaccination well, and no complications or immediate adverse events occurred. She was observed for a full 15 mins per CDPHE/CDC guidelines and left the Clinic in stable condition after her observation period was complete. On the morning of Tuesday, January 19th, 2021, the patient was found unconscious and unresponsive by her husband. She was transferred by Ambulance to Hospital shortly thereafter. She was diagnosed with a brain bleed that was determined to be inoperable. She was transferred to other Hospital for higher level care. She was seen by neurosurgery and diagnosed with a ruptured aneurysm. She was treated in the ICU for 24 hours, at which point her team determined that the severity of her brain bleed would not respond to treatment. Supportive cares were withdrawn on Wednesday Jan 20th, and she passed away shortly thereafter.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

My dad got the Moderna Vaccine on Tuesday, January 12, 2021 in his left arm at the Mall injection site for the Health Department. He was told that the side effects could mean his arm hurting, tiredness, headache, and even a low grade fever. Additionally, the site informed us both (as I was with him to get the injection) that this was all normal and not to seek medical attention unless these symptoms last longer than 72 hours. That evening, my dad was experiencing all of those symptoms, and went to bed at 7pm. A little after 10am on Wednesday, January 13, 2021, when he awoke, my dad went to the bathroom vomiting. This was where he collapsed and went into cardiac arrest. Fire/Rescue was dispatched about 10:30am after my mom started

No prior vaccinations for this event.

CPR. County Fire Rescue EMTs and Paramedics continued CPR and other attempts at reviving him all the way to Hospital Emergency Department. He was pronounced dead at 12:14pm on Wednesday, January 13, 2021. We have no doubt my dad, following the instructions of the injection facility, thought he was just experiencing the side effects of the vaccine. He had no chance. Had this injection been done in the RIGHT arm, perhaps he could have recognized the arm numbness being that of an impending heart attack. We really miss Dad. He served this country with distinction for over 50 years, and we believe his country failed him.

DEATH **COVID19 (COVID19**

(MODERNA)) (1201)

Found dead at home slumped on the floor; Loss of appetite; Body aches; Feverish; A spontaneous report was received from a physician, concerning a 65-years-old male patient, who received Moderna's COVID-19 Vaccine and experienced feverish, body aches, loss of appetite, and death. The patient's medical history, as provided by the reporter, included diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia. Concomitant medications reported included metformin, glimepiride, lisinopril, atorvastatin, aspirin, methimazole, propranolol, and cilostazol. On 05 Jan 2021, prior to the onset of events, the patient received the first of two planned doses of mRNA-1273 (lot number 037k20a) for COVID-19 infection prophylaxis. On an unknown date in Jan 2021, some time after receiving the vaccine, the patient was feeling feverish with body aches and loss of appetite. On 09 Jan 2021 at approximately 21:30, the patient was found dead at home slumped on the floor. According to the paramedics, the patient was dead longer than when his wife found him, and no resuscitation was performed. Action taken with mRNA-1273 in response to the events was not applicable. The outcome of the events, feverish, body aches, loss of appetite, was considered resolved. The patient died on 09 Jan 2021. The cause of death was not reported. The reporter assessed the event, death, as not related to Moderna's COVID-19 Vaccine. The reporter did not provide assessment for the events, feverish and body aches, in relation to Moderna's COVID-19 Vaccine.; Reporter's Comments: This case concerns a 65 year old male patient with medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and hypertriglyceridemia, who experienced the serious unexpected event of death, non-serious unexpected event of loss of appetite, and non-serious expected events of fever and body pain. The event of death occurred 5 days after the first dose of mRNA-1273. The events of fever, body pain and loss of appetite occurred an unspecified period of time after the first dose of mRNA-1273. Very limited information regarding these events has been provided at this time. Based on temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Definitive causal association is confounded by age and medical history of diabetes, hypertension, Hashimoto's, smoker, cataracts, atrioventricular block, occasional premature ventricular contractions, and

No prior vaccinations for this event.

hypertriglyceridemia.

DEATH	COVID19 (COVID19 (MODERNA)) (1201)
death of unknown cause; Swelling on Right side of the neck and under chin; Warmth on right side of neck and under chin; Redness on right side of neck and under chin; A spontaneous report was received from a healthcare professional concerning an 89-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced events of redness, warmth and swelling on right side of neck and under chin, and death of unknown cause. The patient's medical history included Alzheimer's and chronic obstructive pulmonary disease (COPD). No concomitant medications were reported. On 29 Dec 2020, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: Unknown) intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient experienced the events of redness, warmth and swelling on right side of neck and under chin. There was no indication that the patient was transferred out to hospital, which was unlikely because she was under hospice care. On 01 Jan 2021, the patient died due to an unknown cause of death. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2020. The cause of death was not provided. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns a 89-year-old, female subject with a medical history of Alzheimer's and chronic obstructive pulmonary disease (COPD) who experienced redness, warmth and swelling on R side of neck and under chin and expired from an unknown cause. The events of redness, warmth and swelling on R side of neck and under chin occurred 2 days after administration of the first and only dose of the mRNA-1273 vaccine and patient expired 4 days after mRNA-1273 vaccine administration. Lot # of the vaccine was not provided. De-challenge and re-challenge are not applicable. The events of redness, warmth and swelling on R side of neck and under chin are temporarily associated with the administration of the mRNA-1273 and thus, a causal relationship cannot be excluded. Due to limited information, the fatal outcome was considered unrelated to mRNA-1273 administration pending additional information. Fatal outcome is confounded by the patient's underlying condition and advanced age.; Reported	No prior vaccinations for this event.

Cause(s) of Death: Unknown cause of death

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

Patient died. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Fever Feeling tired short of breath all night and morning after the vaccine My grandma had to be intubated and then passed away to a heart distress we think it was the vaccine because she was fine even with dialysis. When she got the vaccine it took hours and her health conditions changed.

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

Pt developed COVID-19 infection, symptoms starting 7 days after first dose was given. Patient was admitted to hospital on 1/21 after falling (secondary to weakness) and striking head on toilet. Patient expired due to respiratory complications of COVID on 1/25.

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

"Pt. woke up the next morning after vaccination and ""didn't feel well"", described by wife as fatigue, no energy. At approximately 2 PM, he vomited. His wife checked on him at 4:20 PM and he wasn't breathing sitting in his chair. EMS squad was called but when they arrived he was asystole and mottling present. Did not start CPR since he was already gone too long. Pronounced by coroner on scene."

No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

patient received vaccine on 1/20/2121, later that night husband found her slumped in chair, called EMS and patient was taken to Hospital where she died on 1/21/2021 No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Resident became lethargic and reports of blood coming from resident's nose and mouth on the morning of 1/13/21. Resident went out to ER for eval, and came back to facility with dx of pneumonia and recommendations for resident to be placed on hospice. Resident deceased on 1/14/21. Unknown if vaccine related, but with timeline of events I was advised to report this per medical director of facility, as well as Pharmacy who administered the vaccine. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

patient received covid vaccine and had a heart attack the next day and died No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Died about 24 hours later No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

"Patient was tested positive for Covid-19 on 12/9/20. Patient received Covid Vaccine on 1/21/21. Patient was observing for 15 minutes in treatment room by Nursing staff. Patient denied any signs/symptoms adverse effect: headache, dizziness & weakness, difficulty breathing, muscle pain, chills, nausea and vomiting, and No prior vaccinations for this event.

fever . Patient seated on treatment table appeared to be relaxed, respiration even and unlabored. Health teaching provided. Patient educated to report any changes in condition to staff immediately. Patient verbalized understanding and able to verbalize signs and symptoms and adverse effects to be aware of related vaccine. On 1/22/21: patient was seen by medical provider for ""altered behavior"". Per medical provider's documentation: ""Patient was fallen on 1/2/21 and was sent out to outside hospital on 1/4/21. CT head: no intracranial abnormality, age-related changes. Patient had labs (B12, RPR, folate) were within normal limit"". We did MMSE today: 22/30 score ""mild dementia"" On 1/23/20: ""Patient was inside his cell. He was walking towards cell door to obtain his breakfast, when custody witnessed him collapse and activated the alarm. Nursing staff arrived at cell front at 06:34 am and found the patient pulseless and unresponsive, and CPR was immediately initiated. AED was attached at 06:35 am and no shock advised. AMR then arrived and patient did not have ROSC, and was pronounced dead at 06:54 am."""

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

On the evening of 10JAN2021, patient experienced a low grade fever, decreased oxygen saturation of 38%, heart rate of 124, confusion. Patient received oxygen via face mask, morphine and ativan. By 11JAN2021, patient was no longer verbal, able to eat or communicate and was kept on comfort measure only. On the morning of 17JAN2021, the patient passed away.

No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Resident deceased on 1/26 at 445am. No signs ahead of time. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Patient received Moderna COVID vaccine on 12/30/2020 at a Pharmacy clinic where he was a resident. Nurses at the facility reported that he was responsive and showed no signs of any adverse effects until 1/2/2021 when he was observed slightly unresponsive and staring at the ceiling and trembling. He had a fever of 101F at this time. The facility ordered labs and a rapid COVID test (all of which came back normal) and started IV antibiotics. A few hours later, patient began bleeding from his eyes, nose, and mouth and was sent to the local ER. The patient refused being admitted to the ICU for possible sepsis/hemorrhage and died the following day on 1/3/2021. All healthcare professionals involved agreed that this was not likely due to the vaccine, but needed to be reported nonetheless.

No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Patient passed away 23 days after receiving COVID vaccine No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

ON 1/21/2020 RESIDENT WAS EXPERINCING CHILLS AND LOOSE STOOLS. FOLLOWING THIS EPISODE BECAME UNRESPONSIVE, PALE, DIAPHORETIC AND BRADYCARDIC. PALLIATIVE CARE WAS PROVIDED. RESIDENT PASSED AWAY APPROX. 10 HOURS LATER.

No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Patient presented to Vaccine clinic 1/12/21 to receive COVID vaccination. Patient denied any ill feeling, no fever, cleared for vaccination. Is chronically SOB due to COPD, but patient reported no different than usual. Presented to the ED the next day c/o SOB and weakness for the last week. Patients condition ultimately declined over the next few days and died 01/21/21 from pneumonia (not COVID). Patient did admit she lied about her symptoms on the day of vaccination to get the shot.

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

on 1/13/2021 at 3:40am Cliff called for assistance. He lost his balance and had fallen. Cliff refused vitals, refused emergency department, denied hitting his head. As the day progressed patient developed a headache, diarrhea, and vomiting. He again declined the offer for the emergency room. At supper time wife and staff found Cliff unresponsive, 911 was called and he was taken to the emergency department. The ER did a CT scan and found an acute subdural hematoma. Patient was placed on comfort cares and expired at 3pm on 01/14/2021. Cliff did not have a history of falls.

Influenza vaccine 10/06/2020, age 88, fever, chills, vomiting, malaise

	DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
Died; Increased respirations (22 and labored at times); Pulse 105; 94% O2 on RA; Labored breathing at times; leukocytosis; elevated BUN; left lower lung congestion; elevated creatinine; Temperature of 102.0F; Redness on face; A spontaneous report was received from a nurse concerning a 92-year-old, female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced redness on face, increased respirations, labored breathing at times, temperature of 102F, pulse of 105, 94 percent O2, leukocytosis, elevated BUN, left lower lung congestion, elevated creatinine, and death. The patient's medical history, as provided by the reporter, included dementia and reduced mobility. No relevant concomitant medications were reported. On 29 Dec 2020, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 30 Dec 2020, the patient began to experience redness on her face, increased respirations (reported as 22 and labored at times), pulse of 105, and 94 percent oxygen saturation on room air. The patient had a fever of 102 degrees Fahrenheit. Laboratory tests revealed a negative influenza swab, elevated white blood cell count of 14.1, elevated BUN at 113, and creatinine 2.7. Chest x-ray showed mild, left lower lung infiltrate. On 31 Dec 2020, the patient went under hospice care per her family		No prior vaccinations for this event.

request.. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 01 Jan 2021, the cause of death was unknown.; Reporter's Comments: This case concerns a 92-year-old, female subject with medical history of dementia and reduced mobility, who experienced the serious unexpected events of death, respiratory rate increased, heart rate increased, oxygen saturation decreased, elevated BUN, elevated creatinine, left lung congestion and dyspnoea and the non-serious events of erythema and pyrexia. The events of respiratory rate increased, heart rate increased, oxygen saturation decreased, dyspnoea, erythema and pyrexia occurred 2 days after the first dose of the study medication administration, and the event of death occurred 4 days after the first dose of the study medication administration. Very limited information regarding the events is available at this time and no definite diagnosis or autopsy report have been provided. Additional information has been requested.; Reported Cause(s) of Death: Died

DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
Extreme bouts of nausea first few days after vaccine. Estimated that patient died at home within 3-4 days after receiving the vaccine. "This is a 73 year old female that received her 1st dose with Moderna vaccine on 1/8/21 at approximately 1600. Within one hour, the patient developed altered mental status and increasing weakness. She was transported to the hospital by the staff at her Assisted Living Facility for concern of a vaccine reaction. On admission, oxygen saturation was found to be 89% on room air, BP=137/86, HR=94. Labs were normal, with the exception of WBC=15 (leukocytes normal, chest xray clear, COVID test negative), and a detectable troponin=63. Head CT negative. Physical exam was only notable for 'slight superficial erythema over distal right forearm and dorsal hand. No significant edema.' The patient was treated for a possible allergic reaction to vaccine with NS bolus, methylprednisolone 125mg, famotidine 20mg, and aspirin 300mg PR. She was admitted for monitoring given continued altered mental status/weakness. The next day, she continued to show no improvement, so a head MRI was ordered. MRI showed "" 1. Numerous acute cerebral and cerebellar infarcts involving both anterior and posterior circulations consistent with a central embolic source. 2. Minimal right parietal petechial hemorrhage. 3. Moderate atrophy and moderate nonspecific white matter signal abnormalities compatible with chronic microvascular ischemia "" Neurology was consulted, who approved the start of aspirin and to continue DVT prophylaxis. The patient's advanced dementia and timeline preclude other intervention. The patient's status was DNR/DNI. The patient was discharged on hospice to her assisted living facility on 1/11/21 (with reports of continued somnolence). It was reported that date of death was 1/24/21."

Within a few days, my mother started reporting profound fatigue and shortness of breath while conducting routine household activities. She no longer had to energy for her daily exercise walks and became increasingly lethargic. She died in her sleep while taking an afternoon nap on Thursday, February 4th. I am highly concerned this could be a vaccine related.

No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Patient received his second dose of Moderna COVID vaccine on 2/6 at 12:40PM. Patient was observed for 15 minutes post-vaccination with no adverse events. On the evening of 2/6 (time unknown) the patient began to develop dry cough and fatigue. He was checked by a physician at that time (who was a family member). Patient continued to feel unwell into Sunday. His lungs were clear when checked Sunday afternoon (time unknown). At approximately 5:30pm on 2/7 the patient began experiencing sudden onset shortness of breath. A pulse ox was conducted at that time and it was 92%, and again shortly thereafter and it was 90% (as reported by family member). 9-1-1 was contacted at this time. CPR was initiated when he arrived at the emergency department, pulse ox was 60% (as reported by family member). The patient passed away shortly thereafter on 2/8/2021.

DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**	
Patient received first dose of Moderna COVID-19 vaccine on 2/3/21. Primary Care physician received call from coroner's office 2/8/21 asking for information contributing to cause of death. Per Primary Care Physician notes, wife states she and patient took turns shoveling snow on 2/4/21. On one trip back into the house she found him unresponsive on the floor and called 911. Paramedics were unable to revive patient and he passed away (2/4/21).		No prior vaccinations for this event.
DEATH		**COVID19 (COVID19 (MODERNA)) (1201)**
Death; kidney failure (unable to urinate); shortness of breath; required oxygen; A spontaneous report was received from consumer concerning an 87-year-old, female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced shortness of breath, kidney failure and death. The patient's medical history included advanced kidney and heart disease. No relevant concomitant medications were reported. On 06 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot: unknown) intramuscularly for prophylaxis of COVID-19 infection. On 17 Jan 2021, the husband reported that the patient experienced adverse events. Symptoms included shortness of breath and kidney failure (unable to urinate). The patient was admitted to the hospital and discharged to hospice. Oxygen was administrated for shortness of breath. Action taken with mRNA-1273 in response to the events was not applicable. On 20 Jan 2021, the patient died. The cause of death was unknown. Autopsy details were unknown.; Reporter's Comments: This case concerns a 87-year-old, female patient with the medical history of advanced kidney and heart disease, who experienced fatal unexpected event of dyspnea, renal failure and death. The events of dyspnea and renal failure occurred 12 days and the event of death occurred 15 days after the first dose of mRNA-1273 (Lot: unknown). The patient was admitted to the hospital and discharged to hospice. Oxygen was administrated for shortness of breath. The cause of death was unknown. Autopsy details were unknown. Very limited information regarding this event has been provided at this time. Based on temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.		No prior vaccinations for this event.

However, the history of advanced kidney and heart disease may remain as confounder. Additional information has been requested.; Reported Cause(s) of Death: Unknown cause of death

DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
Passed away; Positive result; A spontaneous report was received from a consumer concerning a female patient who received Moderna's COVID-19 Vaccine (mRNA-1273) and developed COVID-19 and passed away. The patient's medical history was not provided. Concomitant product use was not reported. On 05 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 08 Jan 2021, the patient had a positive COVID-19 test. On 18 Jan 2021, the patient passed away. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 18 Jan 2021. The cause of death was not reported.; Reporter's Comments: This spontaneous report concerns a female patient who experienced COVID-19 and passed away. The event of COVID-19 occurred 4 days after the first and only dose of the mRNA-1273 vaccine administered and death occurred 14 days after administration of the mRNA-1273 vaccine. Based on the information provided and the known etiology of COVID-19, it is unlikely to be associated with mRNA-1273 vaccine administration. With no definite information on the clinical details of the death, it is difficult to adequately assess a causal association with mRNA vaccine. Main field defaults to æpossibly related'; Reported Cause(s) of Death: unknown cause of death	No prior vaccinations for this event.

DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
"The decedent experienced severe chest pain and dyspnea approximately nine days following the first series of the vaccine. He reported to family members that he was having a ""severe reaction"" to the vaccine and believed it was acute pericarditis due to the same symptoms he experienced prior. He reported that on 2/1/21 around 0300 hours, the symptoms were the most severe and he was going to seek medical attention, but did	No prior vaccinations for this event.

not. He waited till the convenient store opened and purchased OTC Tylenol for relief of symptoms. He continued to have dyspnea and chest pain up until 2/9/21, when he called 911 complaining of chest pain and was found to have a STEMI; subsequently died at Hospital in the ER."

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

Patient had the first Moderna Covid vaccine on Thursday 1/21/2021. She had a bit of sore arm on that day and the day after. On Saturday 1/23/2021, she had a fever of 100.5 F (11AM), nausea, light headache and chills. The temperature went down after she took ibuprofen. Patient's husband enrolled her to V-Safe to report all the adverse effects she experienced. On Sunday 1/24/2021, her temperature was 98.3F. She still had nausea and no appetite. She and her husband watched a football game in their bedroom upstairs. Husband noticed that his wife was pacing around the room many times. At 7Pm, Husband went downstairs for dinner but she refused to come down to eat. He went upstairs around 8pm, TV was still on. He turned off TV and went down stairs again thinking his wife felt as sleep while watching TV. He went back upstairs for bed around 10:30 PM. Husband said his wife had a deviated septum so she would snore very loudly when asleep. He didn?t hear her snoring so he went to check on her and found her not responsive. Husband called emergency services. Paramedic came at 10:45 and said patient was passed. Husband sent many texts to V-safe after that to report the incident. No response was received from V-safe. Patient?s doctor told her

Resident reviewed for incident. Resident received the second dose of the Moderna Covid-19 vaccine lot# 016M20A Exp 5/2/2021 on 2/5/2021 from clinic through pharmacy. Resident had her temp/O2 taken on AM shift and was 98.6/93%, beginning PM shift 98.4/95%. A few hours later noted that resident to have chills and was shaking RN assessment completed and vitals taken resident noted to have temp of 102.2, oxygen 95%, pulse 110. Resident alert and oriented at that time and talking to staff. Reported findings to APNP with order to send to ER. 911 called, residents brother updated. Upon EMT arrival RN went down to residents room with EMT and resident had an emesis as resident was getting cleaned up resident went unresponsive. Pulse noted to still be present at that time, resident did briefly respond to sternal rub and then went unresponsive again. Resident full code and EMT transferred to gurney and said that if they lost a pulse in route that they would transfer to hospital B instead of hospital A being the closest facility. RN called brother and gave update. Facility notified from Hospital that resident had passed away.

extreme fatigue. could not awaken for more than few seconds. When briefly awake she was coherent and not confused. slept deeply from 4pm and could not wake to eat or drink. No fever, bp normal, blood oxygen ok. Blood sugar at 11pm was 230. Gave her 15u lantus at 11pm (normally 25u). Was sleeping at 2:30am but had died at next check at 3:30am. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

I video chatted with her Thursday after receiving the vaccine. My mom was in poor health but she was talking in complete sentences and responded appropriately. She was upright in bed and made eye contact. She smiled and denied pain. By Sunday, she was extremely weak and unable to sip water with a straw. Her health had changed dramatically and rapidly. She moaned in pain and was very fatigued. Her condition continued to deteriorate over the week and she stopped talking and was constantly sleeping. They started antibiotics for the oozing cancer lesion and then morphine for pain and end of life care. She passed away on January 22nd which was 15 days post vaccination. DEATH		**COVID19 (COVID19 (MODERNA)) (1201)**
Died the next day; A spontaneous report was received from a consumer concerning a male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and died the next day. The patient's medical history was not provided. Concomitant medication use was not provided by the reporter. On 12 Jan 2021, approximately one day prior to the event, the patient received one of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On 13 Jan 2021 the patient died. No additional information was provided in regards to the event. Action taken with mRNA-1273 in response to the event was not applicable. The patient died on 13 Jan 2021. The cause of death was unknown.; Reporter's Comments: This case concerns a male patient of unknown age. The medical history and concomitant medication were not provided. The patient died approximately one day after receiving their first of two planned doses of mRNA-1273 (Lot unknown). Very limited information regarding this event has been provided at this time.; Reported Cause(s) of Death: Unknown cause of death		No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

Passed away; tired; nonresponsive; cold; difficulty breathing; swelling; sore arm; feeling weird and funny; A spontaneous report (United States) was received from a consumer concerning a 63 year old male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and the patient experienced limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal and the patient passed away . Medical history included treatment for tuberculosis and dialysis. Concomitant medication included calcium acetate, Renvela, glipizide, omeprazole, aspirin, vitamin D, losartan, furosemide, rifampin, and Sensipar. On 14 Jan 2021, the patient received the first of their first planned doses of mRNA-1273 (lot number 030L20A) for prophylaxis of COVID-19 infection. On 13 Jan2021, the patient tested negative for COVID-19). On 16 Jan 2021, the patient experienced a sore arm, and feeling weird/funny. On 17Jan2021, the patient experienced difficulty breathing and swelling. On 18 Jan 2021, the patient declined dialysis, was tired and wanted to lay down. At 8 am, the patient was found nonresponsive and cold and is believed to have passed away around 4 am. The coroner tested the deceased for COVID-19 and the test was positive. No autopsy was reported. No death certificate was issued at the time of the report but the reporter believes it will list cause of death as COVID complications. Action taken with the mRNA-1273 was not applicable. The outcome of the events of limb discomfort, feeling abnormal, dyspnea, fatigue, swelling, unresponsive to stimuli, body temperature abnormal, was fatal. On 18 Jan 2021, the patient was died. Cause of death was COVID-19. Autopsy details were not provided.; Reporter's Comments: The events developed on four days after first dose of mRNA-1372. Dyspnea, unresponsive to stimuli, and death were consistent with infection in pandemic set up confounded by age of patient and refusal of dialysis Cause of death was reported as COVID-19. Autopsy details were not provided. Based on reporter's causality the events are assessed as unlikely related to mRNA-1273.; Reported Cause(s) of Death: COVID-19

Toileting and had expired while doing so; Severe abdominal pain; Diarrhea; Vomiting; Mild injection site pain; A spontaneous report was received from a healthcare professional concerning an 88-year-old , female patient who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced the events, toileting and had expired while doing so (death), mild injection site pain, severe abdominal pain, diarrhea, and vomiting. The patient's medical history was not provided. No relevant concomitant medications were reported. On 20 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number: 029L20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 20 Jan 2021, the patient felt mild pain at the injection site after receiving the vaccine. On 21 Jan 2021, the patient reported severe abdominal pain, diarrhea and vomiting. These symptoms were intermittent for a week and no other adverse events were noted. On 27 Jan 2021, the patient passed away while toileting. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 27 Jan 2021. The cause of death was unknown. An autopsy was not performed.; Reporter's Comments: The gastrointestinal events were consistent with increased risk associate with elderly age of patient. The cause of death was unknown. Autopsy was not performed. Very limited information regarding the events is available at this time. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.; Reported Cause(s) of Death: unknown cause of death		No prior vaccinations for this event.

Patient previously had dizzy spills, but about a week after receiving the vaccine her dizzy spills began to get worse. The whole prior she kept saying I am just not right. On the 2/7/21 she a COVID test done, a nurse came to her house and preformed. On the morning of the 8th patient was on the phone with someone else and patient asked this person to call me and go check on her. Within 5 minutes I was over at her house, and I found her on the floor, she on her belly facedown. It looked like she was on the toilet, and it looked like she fall getting her off, she was still wet, she still felt warm. I called the ambulance and immediately began CPR. When EMS arrived they took over the CPR and transported her to the Hospital. The EMS was there for about 40 minutes and used an machine to preform the compressions. She was pronounced deceased at the hospital. No autopsy was done. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Patient reported feeling weak, fatigue, fever (102), and loss of appetite. Patient subsequently went to the ER 2/6/2021 and tested positive for COVID-19 on 2/7/21 (collection date). See following discharge summary from ED: 82 y.o. female who initially presented to the ED with complaint of generalized weakness, fatigue, fever, and loss of appetite x at least 4 days since receiving Covid 19 vaccine. Her workup in the emergency room was significant for hypoxia with 02 saturation 88% on 2LPM (home nocturnal 02 requirement) with improvement to mid-90s on 4LPM. Blood sugar was 47, Cr 1.61. CXR showed extensive R lung and moderate left lung opacities. She was started on empiric ceftriaxone and azithromycin and admitted to the hospitalist service for further workup and mgmt. During her stay in the hospital, pt did test positive for Covid 19. She developed rapidly progressive respiratory failure, felt to be secondary to ARDS. There was also question of contributing pulmonary edema, however this was refractory to lasix and thus ARDS was felt to be the most significant factor. She had requested DNR/DNI status, thus as her 02 requirement escalated she was transitioned to 15LPM NRB and then to BiPAP support. Unfortunately, she continued to suffer greatly with the BiPAP in place, and therefore made the decision to transition herself to comfort measures only after visitation from her family. Her other medical issues were supported as appropriate during her stay, with dextrose infusion for hypoglycemia and AKI, also hyponatremia felt to be due to IVVF. Unfortunately, am unable to find any documentation regarding how pt was feeling when she received the vaccine compared to her baseline state of health. thus am unable to say whether the severity of her illness represents vaccine¡ enhanced disease or the much more common cytokine release syndrome leading to ARDS. Regardless, she developed ARDS as result of her Covid 19 illness. Time of death: 1408 on 2/9/21. Cause of death: ARDS due to Covid 19 pneumonia.

COVID19 (COVID19 (MODERNA)) (1201)

Passed away; Found unconscious; Coma; Lack of oxygen to the brain; A spontaneous report was received from a consumer, concerning his mother, a 71-year-old female patient, who received Moderna's COVID-19 vaccine (mRNA-1273) and passed away, prior to death, patient experienced lack of oxygen to the brain and was found unconscious and went to coma. The patient's medical history reported included seizures. Concomitant medications included phenobarbital, lamotrigine and levetiracetam. On 27 Jan 2021, approximately six days prior to the onset of events, the patient received their first of two planned doses of mRNA-1273 (lot number: 030L20A) intramuscularly for prophylaxis of COVID-19 infection. On 01 Feb 2021 at 4 am, the patient was found to be unconscious on the couch, hence she was rushed to the hospital with lack of oxygen to the brain. Later, she went into a coma, hence she was in hospital for 30 hours and then was transferred to a different hospital for a second opinion on 06-Feb-2021, where she was passed away at 02:20 PM. Treatment information was not provided Action taken with mRNA-1273 in response to the events were not applicable. The outcome of events, lack of oxygen to the brain, found unconscious and coma were considered unknown. The outcome of event passed away was fatal as she died on 06 Feb 2021 at 2:20 pm. The cause of death was not provided. Plans for an autopsy were unknown.; Reporter's Comments: This is a case of 71-year-old female subject with a history of seizures who died 6 days after receiving first dose of vaccine. Very limited information has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Passed away

DEATH **COVID19 (COVID19 (MODERNA)) (1201)**

Approximately 2 weeks after the first COVID vaccine she developed shortness of breath that was much more significant than she had previously. This was the first time she had expressed this symptom to me as being something she was concerned about and difficult for her to manage (we have spoken almost daily for many years). Within 24 hours of the second dose of the mRNA vaccine, they called an ambulance to get her and she was taken to the hospital and diagnosed with bacterial pneumonia. The doctors said it was unrelated, but I found a study with a different vaccine (LAIV) that also seemed to increase the incidence of bacterial pneumonia. They hypothesized through diverting the immune system. So while I don't think the vaccine gave her the bacteria, I do think it may have caused her immune system to be temporarily compromised allowing the bacteria to grow out of control. I feel this is important to report to look for these types of patterns as perhaps it can help others avoid the death spiral that happened to my mother. There were also intervening events between her hospitalization and her death including two successful surgeries (one for a broken hip and another to put in stents in her leg). So to summarize, the first vaccine was within about 2 weeks of the onset of her breathing problems. Within 24 hours of the second vaccine she was hospitalized and diagnosed with bacterial pneumonia. As she was battling bacterial pneumonia in the hospital she broke her hip and was found to have reduced peripheral circulation and had 2 surgeries to correct those. They were successful according to the surgeons, however she died within a week or so of the surgeries. She had other comorbidities as well which I'm sure predisposed her such as diabetes, hypertension and cancer for many years.

Breathing issues ~2 weeks after first dose of mRNA vaccine in the series but were not nearly as acute or severe as they were fol

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

loss of consciousness;febrile Narrative: Patient received his 2nd vaccine at 10am 2/17. That evening he felt subjectively febrile and then suffered a ground level fall at 0400 on 2/18. He did not lose consciousness or injure his head. EMS was contacted and assisted him into bed. At 0600, wife noted increased work of breathing, which prompted another EMS call, who found him hypoxic with fever of 106. He was transported to

No prior vaccinations for this event.

a community hospital, where he was found to have temp 102.9 and blood pressure in 70s-80s systolic. He was transferred to hospital at 1300 on 2/18/21, requiring norepinephrine for pressure support after fluid resuscitation. He c/o stiffness and soreness all over but presenting ROS was otherwise negative. Patient was treated with 4L IV fluids and vancomycin and piperacillin/tazobactam at the outside ER. Here at the hospital he was treated with vancomycin, piperacillin/tazobactam and levofloxacin along with IV fluids and norepinephrine. Despite this he had several fevers with Tmax 103.5F the night of 2/18-2/19 and he required norepinephrine plus vasopressin overnight to maintain blood pressure. Piperacillin/Tazobactam was discontinued in favor of meropenem. His last fever was at 6am on 2/19. ID consult was obtained 2/19/21 and vancomycin and levofloxacin were weaned off. Ultimately his blood pressure improved and he was weaned off of all vasopressors the morning of 2/20. Notably, he never developed severe hypoxemia at rest while in the ICU, but did require BiPAP non-invasive ventilation at night instead of his usual CPAP to keep his oxygen levels > 90% while sleeping and additionally had desaturations into the low 80% range with exertion from which he was slow to recover. His oxygen saturation was >90% on 30-40% FiO2 via aerosol mask overnight and 3L (his current baseline) NC during the day. He was transferred out of the ICU on 2/21 based on hemodynamic improvement, stable oxygenation, and improved mentation and symptoms. Unfortunately, on the morning of 2/22/21, patient had an abrupt change in status and was found to be unresponsive with hypercarbic respiratory failure and hypotension. ABG during this event was 7.16/121/65. BiPAP was initiated as patient's code status was DNR/DNI. CXR with no significant change from 2/18/21. CT of head without contrast was negative for acute processes. Based on lack of rapid improvement, the decision was made by wife to transition to comfort care. Patient died at 1446 on 2/22/21. **Of note: patient was admitted for 1 week for covid 19 pneumonia November 2020. During this hospitalization he was found to have chronic R sided PE, no acute PE.

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

Hypoxia, Decreased responsiveness, Narrative: 86yo male with PMHx HTN, Afib not on AC after head trauma, CVA, and colon cancer who was brought to the ED by his family on 2/17. Per documentation the pt

No prior vaccinations

was in his usual state of health until 2/16. Received Moderna covid vaccine #2 on 2/16/21 at 0900, and was monitored for 15 minutes following immunization no noted issues. Later that night, had myalgias and took Tylenol. Per the family he slipped on the ice and fell on his butt. Overnight, had several dark stools and vomitus. was brought to the ED by his family because he was being less responsive. Pt arrived to the emergency department in extremis. No pulse identified. CPR immediately initiated for several rounds lasting about 25-30 minutes. ROSC unable to be achieved. Patient expired on 2/17 at 1941. Of note, per previous documentation had waxing and waning mental status at baseline. No symptoms noted with 1st dose of Moderna vaccine, which was administered on 1/16/21.		for this event.
	DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
Do not know if patient informed her physician that she received vaccine on 1/29/2021. She had appt at 3:15 pm on 1/29 and afterwards stated she received the Moderna vaccine. Reporter is uncertain if this was at a health office or clinic. She drove herself to the ER at about 3am on 1/30/2021 with increased cramping and pain.		No prior vaccinations for this event.
	DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**

	DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
I am the patient's daughter as well as an RN-BSN. My mother was given the Moderna vaccine on Feb 11, 2021 and on Feb 15, 2021 she had a CVA and MI. She was found on her apt. floor unconscious. She was transferred to the Hospital by ambulance where a CT scan and other tests were done. It was determined she		No prior vaccinations for this event.

had a stroke and heart attack. My mother was in great health, took no medications, and lived alone in her apt. before this incident. The medical professionals determined she would not recover so she was admitted to hospice and died on Feb. 21, 2021. I believe there is a relationship between the vaccine and the CVA and MI.

DEATH

COVID19 (COVID19 (MODERNA)) (1201)

Died at home; Gasping for air/difficulty breathing; Soreness; A spontaneous report was received from a physician concerning a 45 years-old, female patient who experienced soreness/MedDRA PT: pain, gasping for air/difficulty breathing/MedDRA PT: dyspnoea and subsequently died/MedDRA PT: death. The patient's medical history included blood pressure (disorder not specified), thyroid disorder, depression and anxiety. Concomitant product use included blood pressure medication, thyroid medication and possibly depression and anxiety medication. On 28 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot #007M20A) (route of administration and injection site not provided) for prophylaxis of COVID-19 infection. On 28 Jan 2021, following the vaccination, the patient was fine but had experienced some soreness. Per patient's coworker, the patient did not take any medication as it made the patient sick. The physician was not aware of any complaints from the vaccine. On 13 Feb 2021 at 3:31am, the patient called 911. Per the 911 call, the patient was gasping for air on the call and having difficulty breathing. The patient subsequently died on 13 Feb 2021 at home. The physician inquired whether Moderna gets involved with the autopsy and logistics of the death of patients and wanted to know the time frame for reporting a death of a patient who received the vaccine. The physician did not know who administered the patient's vaccine. Action taken with mRNA-1273 in response to the events was not applicable as the patient deceased. The event died was fatal. The outcome for the events soreness and gasping for air/difficulty breathing was unknown. The patient died on 13 Feb 2021. The cause of death was not provided. Plans for an autopsy were not provided.; Reporter's Comments: Very limited information regarding the event of dyspnea and death has been provided at this time. Further information has been requested. Patient's medical history of blood pressure is considered a risk factor. Based on the current available information and temporal association between the use of the product and the onset of the pain, a causal relationship cannot be excluded.; Reported Cause(s) of Death: Died at

	DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
Death; A spontaneous was received from a consumer concerning a male patient, who received Moderna's COVID-19 vaccine and who died. The patient's medical history was not provided. No relevant concomitant medications were reported. On 23-Jan-2021, prior to the onset of the event, patient received their first of two planned doses of mRNA-1273 (Lot number:013620A) intramuscularly for prophylaxis of COVID-19 infection. On 25-Jan-2021, approximately 2 days after injection, patient Died. On 26-Jan-2021, neighbor Reporter called in to report a potential AE death. She shared that she lives in a condo building with other elderly. She shared that she and 2 other neighbors went to a vaccination site in Miami at a fire department. She shared that she is fine but that her neighbor died two days after shot. She shared that she didn't know if he had symptoms and that she knows that he had a lot of medical issues and was on about 15 medicines. She shared that she didn't know his age but guessed 70. She said we can contact his wife, but it must be a Spanish speaking agent because she speaks little English. She is concerned because they all received the vaccine at the same time. She wanted to reiterate that she was fine but believed we should know about the neighbor's death. No treatment information was provided. Action taken with the second dose of mRNA-1273 in response to the event death is not applicable. The patient died on 26-Jan-2021. The cause of death was not provided. Plans for an autopsy were not provided.; Reporter's Comments: Very limited information regarding this event/s has been provided at this time. Further information has been requested. The cause of death was not provided.; Reported Cause(s) of Death: Unknown		No prior vaccinations for this event.

	(MODERNA)) (1201)
Passed away; UTI; Abnormal bleeding; A spontaneous report was received from a healthcare professional concerning a patient who received the Moderna COVID-19 Vaccine (mRNA-1273) and experienced abnormal bleeding, UTI, and passed away. The patient's medical history included a long term history of anticoagulation therapy. Concomitant product use included anticoagulation therapy. On 31Jan2021 prior to the onset of the events the patient recieved their first dose of mRNA-1273 (Lot number:not reported) intramuscularly for prophylaxis of COVID-19 infection. On 07Feb2021, the patient complained of abnormal bleeding. Patient was seen at clinic on 10Feb2021 and was diagnosed with a UTI and given antibiotics. An INR was also completed that day due to patient having a long term history of anticoagulation therapy. Results of that showed the INR to be 12. Prior to vaccination, patient's INR was normal and no changes to medications and diet were made after vaccination and prior to complaint starting. On 12Feb2021 the patient passed away. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12Feb2021. The cause of death was unknown. Plans for an autopsy were not provided.; Reporter's Comments: This case concerns an 82 year old male patient, with history of long term anticoagulation therapy (unknown indication), who experienced a fatal event of death and abnormal hemorrhage, 13 days after receiving second dose of mRNA-1273 (Lot# Unknown). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death	No prior vaccinations for this event.
DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
Unresponsive; A spontaneous report was received from Pfizer concerning a 43-year old, male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and had a sudden death. The patient's medical history was not provided. No relevant concomitant medications were reported. On 08 Jan 2021, prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot/batch: unknown) for prophylaxis of COVID-19 infection. On 09 JAN 2021, the patient died. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 08 Jan 2021.	No prior vaccinations for this event.

The cause of death was not provided/unknown. Plans for an autopsy were unknown/not provided.; Reporter's Comments: Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death

DEATH	**COVID19 (COVID19 (MODERNA)) (1201)**
chronic hypoxia respiratory failure; Unresponsive; A spontaneous report was received from Pfizer concerning a 51-year old, male patient who received Moderna's COVID-19 vaccine (mRNA-1273) and had developed hypoxia a sudden death. The patient's medical history was not provided. No relevant concomitant medications were reported. On 07 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (lot/batch: unknown) for prophylaxis of COVID-19 infection. On 07 Jan 2021, around 6:00 pm, the patient became increasingly hypoxic. He was transported to the hospital for acute on chronic hypoxia respiratory failure. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not applicable. The patient died on 12 Jan 2021 at 11:25pm. The cause of death was not provided/unknown. Plans for an autopsy were unknown/not provided.; Reporter's Comments: Very limited information regarding these events has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: unknown cause of death	No prior vaccinations for this event.

information has been requested.; Reported Cause(s) of Death: unknown cause of death

DEATH	COVID19 (COVID19 (MODERNA)) (1201)
Blood pressure went down until he died; Couldn't hear his heartbeat; neck was sweating; He was cold; Couldn't get up; Death; Sick; immediately very tired; he was tired; Hands were shaking; Slept for too long; A spontaneous report was received on 18 Feb 2021 from a consumer concerning a 81-years-old, male patient who received Moderna's COVID-19 vaccine and developed immediately very tired, hands were shaking, neck was sweating, was cold, sick, couldn't get up, couldn't hear his heartbeat and blood pressure went down until he died. Patients' medical history, as provided by patient's spouse, was emergency room(ER) admission in November 2020 because he had a congested chest (he had fluid around his heart). At that time, they gave him pills for kidney function. Other concomitant medication reported was Coumadin, blood thinner. Two weeks before receiving the vaccine, patient's EKG was normal. On 11 Feb 2021, in the morning, patient received their first of two planned doses of mRNA-1273(BATCH/LOT # 007M20A) probably in the right arm for the prophylaxis of COVID-19 infection. On 11 Feb 2021, approximately after 15 minutes of receiving vaccine, they left and patient was immediately very tired, his hands were shaking. So, patient's spouse made them down sleep for too long. On Friday, 12 Feb 2021 she tried to pick him up, but he was tired, exhausted, and sick. On Saturday, 13 Feb 2021, she brought him a coffee and he couldn't hold it because his hands were shaking, so she gave him the coffee and then made him pee on the bed because he couldn't get up. At lunch time she made him eat something and he fell sleep again. His wife was hanging around him all day and around 7:30pm she realized that he was cold, and his neck was sweating, she couldn't hear his heartbeat. So, she called emergency services and when they arrived, her husband's blood pressure went down until he died. Treatment for the events were not provided. Action taken with mRNA-1273 was not applicable. Patient was pronounced dead on 13 Feb 2021 20:00. The cause of death was not provided. The plans for an autopsy were not provided. The events of blood pressure went down until he died and couldn't hear his heartbeat were fatal. The outcome for the remaining events were unknown.; Reporter's Comments: This case concerns an 81 year old, male patient, who experienced a serious event of death among others, 2 days after receiving mRNA-	No prior vaccinations for this event.

1273 (Lot# 007M20A). Very limited information regarding this event has been provided at this time. Further information has been requested.; Reported Cause(s) of Death: Unknown cause of death

scene and did CPR for 30 mins and she was pronounced dead at 9:21am.

DEATH	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
COVID-19; COVID-19; Pneumonia; respiratory failure; This is a spontaneous report from a contactable consumer. An 80-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 02Jan2021 for COVID-19 immunization. Medical history included Alzheimer's and others. No known allergies. Concomitant medications included unspecified medications. The reporter's mother in law was tested for COVID-19 at a nursing facility on 25Dec2020 and she was negative. On 02Jan2021, she received the first dose of Pfizer vaccine. On 04Jan2020, she developed a high fever, needed oxygen and was positive for COVID-19. Date of death was 04Jan2021. The cause of her death was listed as pneumonia, respiratory failure and COVID-19. No autopsy performed. No treatment received. No one knew if the vaccination contributed to her death. It was hard to know if her death was due to the administration of the vaccine or it exacerbated the COVID19 symptoms which led to her death. Since this was unknown, it could have been a possibility. The reporter wanted to give us this information because we might want to consider having high risk population, patients with underlying conditions, older population tested for COVID-19 prior to the vaccination, as this is not currently a recommendation or a requirement. All is very new and they are all learning so the reporter wanted to share this information with us. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There are medications the patient received within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The outcome of the events was fatal. Information about Lot/Batch has been requested.; Sender's Comments: The association between the fatal event lack of effect (pneumonia, respiratory failure and COVID-19) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well	No prior vaccinations for this event.

as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19

DEATH	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall	No prior vaccinations for this event.

asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

emesis or loose stool noted. 12PM nurse noted resident not eating meals but ingesting milkshake and medications without any problems. Hospice contacted for change in condition. 1:00 pm hospice ordered Phenergan 12.5 mg Q 6 hrs PRN. Labs to be drawn 1/11/21. Hospice notified POA. 1/11/21 12:24am Resident had blood in stool. Resident denies any pain, on 2L of O2 for comfort.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
	patient passed away after receiving the Covid vaccine; This is a spontaneous report from a contactable nurse. An 81-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), intramuscular into the right arm on 07Jan2021 at 0.3 mL, single for covid-19 immunization. There was no medical history and no concomitant medications. On 08Jan2021, the patient passed away after receiving the COVID vaccine. The patient died on 08Jan2021. An autopsy was not performed. Investigations indicate that unspecified labs were done, but nothing two weeks prior; no further details were provided. The patient received the first dose the day prior. The reporting nurse discussed it with the medical director, and he thought that he potentially passed away from the COVID vaccine. The relatedness of the event to the suspect vaccine was reported as related by the reporting nurse per The Agency. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up .; Sender's Comments: Based on the limited information available, it is medically not possible to make meaningful causality assessment, it is unlikely the vaccine could have contributed to the death of the patient based on the known safety profile. However case will be reevaluated when additional information is received during the follow-up The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Stated that the patient passed away after receiving the Covid vaccine	No prior vaccinations for this event.

DEATH	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"Cardiac Arrest; Patient was found pulseless and breathless 20 minutes following the vaccine administration.; Patient was found pulseless and breathless 20 minutes following the vaccine administration.; This is a spontaneous report from a contactable other healthcare professional (HCP). A 66-year-old female patient (pregnant at the time of vaccination: no) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1284) via intramuscular at left arm on 11Jan2021 12:15 PM at single dose for COVID-19 immunization. Medical history included diastolic CHF, spinal stenosis, morbid obesity, epilepsy, pulmonary hypertension and COVID-19 (Prior to vaccination, the patient was diagnosed with COVID-19). The patient received medication within 2 weeks of vaccination included amiodarone, melatonin, venlafaxine hydrochloride (EFFEXOR), ibuprofen, aripiprazole (ABILIFY), lisinopril, cranberry capsules, diltiazem, paracetamol (TYLENOL), famotidine, furosemide (LASIX [FUROSEMIDE]), ipratropium bromide, salbutamol sulfate (IPRATROPIUM/ALBUTEROL), buspirone, senna alexandrina leaf (SENNA [SENNA ALEXANDRINA LEAF]), polyethylene glycol 3350 and morphine. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient used took Penicillin, propranolol, quetiapine, topiramate, Lamictal and had allergy to them. Patient used took the first dose of BNT162B2 (lot number: EJ1685) via intramuscular at right arm on 21Dec2020 12:00 PM at single dose for COVID-19 immunization. Since the vaccination, the patient been tested for COVID-19 (Sars-cov-2 PCR) via nasal swab on 06Jan2021, covid test result was negative. Patient was found pulseless and breathless 20 minutes following the vaccine administration (11Jan2021 12:30 AM). MD found no signs of anaphylaxis. Patient died on 11Jan2021 12:30 AM because of cardiac arrest. No treatment received for the events. Outcome of pulseless and breathless was unknown. the autopsy was performed, and autopsy remarks was unknown. Autopsy-determined cause of death was unknown. It was reported as non-serious, not results in death, Life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect.; Sender's Comments: Based on the available information this patient had multiple underlying medical conditions including morbid obesity, diastolic CHF, epilepsy, pulmonary hypertension and COVID-19	No prior vaccinations for this event.

diagnosed prior to vaccination. All these conditions more likely contributed to patients cardiac arrest resulting in death. However, based on a close temporal association (""Patient was found pulseless and breathless 20 minutes following the second dose of BNT162B2 vaccine administration, contributory role of BNT162B2 vaccine to the onset of reported events cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Cardiac arrest; Autopsy-determined Cause(s) of Death: autopsy remarks was unknown. Autopsy-determined cause of death was unknown"

DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Actual event and cause of death were unknown; This is a spontaneous report from a non-contactable consumer. A 90-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at single dose for COVID Prevention. The relevant medical history included aortic valve replacement from Nov2019. Concomitant medications were not reported. The consumer stated that she was taking the reporting responsibilities to report that a friend of hers, informed that the patient passed away on Friday, and had received the COVID vaccine on Wednesday. The consumer stated that it was unknown to her at this time, if the friend had called to complete a report herself, regarding the incident. Their conversation was very brief. The patient was 90 years old, and it was her friend's mother that was the patient. Actual event and cause of death were unknown. The patient had her vaccine on Wednesday 06Jan2021, and then the patient collapsed in front of the reporter at Friday night on 08Jan2021 and passed away that same day. The autopsy was unknown. The outcome of the event was fatal. No follow-up attempts are possible; information about lot/batch number	No prior vaccinations for this event.

cannot be obtained.; Reported Cause(s) of Death: Actual event and cause of death were unknown

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of

No prior vaccinations for this event.

0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

DEATH **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Family was told that Patient expired in his sleep during the early morning hours of 1/15. I spoke with him the evening before (on 1/14), which was a day after he had received the Covid vaccine. He was not having any symptoms of allergy or reaction then. He did say that he felt tired, but he often complained of feeling tired over time.

No prior vaccinations for this event.

"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated	No prior vaccinations for

medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."	this event.

"died; tested positive for COVID; tested positive for COVID; This is a spontaneous report from a contactable consumer from a Pfizer-sponsored program, Pfizer First Connect. A 97-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 30Dec2020 at 97-years-old at a single dose for COVID-19 immunization; administered by the nursing home. Medical history included glaucoma from an unknown date and unknown if ongoing. Concomitant medications included: ""used a sav for skin tears"", and ""eye drops for glaucoma"" from an unknown date to an unknown date. On 07Jan2021, the patient experienced: tested	No prior vaccinations for this event.

positive for COVID (medically significant). The patient died (death, medically significant) on 17Jan2021. The clinical course was reported as follows: The reporter stated that in regard to the patient's height and weight: ""was probably getting down to about five foot eight. Shrinking."" The reporter stated that If she remembered correctly, they were trying to maintain the patient's weight 135 to 136 pounds. The reporter stated that her father was in a nursing home. The patient received his first dose of the COVID vaccine on 30Dec2020. The patient died on 17Jan2021. The reporter stated that she ""wanted Pfizer to know that the little old people in the nursing might not be strong enough for the vaccine."" The reporter stated that she was ""not calling to complaining."" The reporter stated that there was nothing wrong with her dad. He was elderly with no health issues. ""He was literally on no medications. The only reason he was in the nursing home was because he was afraid to walk."" The reporter stated that she received a call about giving the patient the vaccine and she said yes because she wanted him to have the vaccine. One week after the vaccine, the patient tested positive for COVID ""like all the other people"" (no further details provided). The reporter stated that her dad had no symptoms of COVID. The director of nursing said the patient was doing so well. The patient ate his lunch, he laid down for nap, and at 14:30 he was gone. The patient ""went peacefully in his sleep."" The reporter then again stated that the patient literally had nothing wrong with him. ""They were shocked. They fed him and he took a nap. He was sleeping, but it was eternally."" The reporter stated that, ""it might not have been the Pfizer vaccine, maybe his heart wore out."" In regard to an autopsy: the reporter stated that they would get it done if needed. The patient underwent lab tests and procedures which included COVID-19 virus test: positive on 07Jan2021. History of all previous immunization with the Pfizer vaccine considered as suspect: none. It was unknown if there were additional vaccines administered on the same date of the Pfizer suspect, but the reporter doubted it. There were no prior vaccinations within 4 weeks. There were no adverse events following the prior vaccinations. The clinical outcome of the event, died, was fatal. The clinical outcome of the event, tested positive for COVID, was unknown. The patient died on 17Jan2021 due to an unknown cause of death. An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: died"

DEATH	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
At approximately 930am I arrived at Memory Care. I met with the director of the facility and she directed me to where my team would be setting up. My team consisted of (technician), (nurse) and I. As we were setting up, the director asked how she can help. I explained to her that we would need a designated area for patients to be monitored after vaccination for 15 minutes and maybe even longer . I also explained that we would need one of her staff monitoring while we vaccinate. She agreed, and proceeded to designate her staff and the cafeteria area, facing the vaccination station,the monitoring station. Throughout the day, nurse and I were both vaccinating,while the staff of the facility would monitor the vaccinated patients. I would also stop occasionally to mix the vaccine and check the temperature of the aero safe. At approximately 12:50pm, the director rushed in and stated that a patient is not responding, and that she had been vaccinated. At that point, I grabbed epipens and a thermometer and I also instructed nurse to grab an Epipen and come with me. We followed the director to pt's room. Once we got to the room, the patient was in bed and there were 4 staff members standing bedside and one of them turned and stated the patient has passed. At that point I asked the staff how long ago did the patient get the vaccine, they stated about 30 minutes ago. They also stated that the patient was a hospice patient and that the patient had declined, and was rapidly detiorating and had not eaten or drank anything all day . They also stated that the patient had been monitored for 15 minutes post vaccination. I then left the room and grabbed the patients COVID Vaccine intake consent form. I looked at the answered questionaire and all the responses were circled NO. Patient had a temp of 96.5 at the time of vaccination.The vaccine administration information for Immunizer Section was filled out by Nurse. I then proceeded to ask the director once again if there were staff that was monitoring her for 15 minutes, the director stated they had staff monitoring her. She also stated the Hospice nurse has to announce her death, so they waited for the Hospice Nurse to come. I then called Corporate and explained the situation. After speaking to corporate, I also asked nurse, if she remembered the patient. She stated that she did and at the time of the vaccination the patient was not alert, there were two staff members with the patient. She was non oriented and she kept closing her eyes. At that point, Nurse stated	No prior vaccinations for this event.

that she asked the two staff members with her if this is how she usually is and if its ok to vaccinate her. Both Staff members stated that it its ok,this is how she is. The Nurse then proceeded to vaccinate. At approximately 3:10pm, as I was leaving I spoke to the director, and one of her Staff members. Staff that the patient has actually not eaten/ or drank anything for the past several days, including today(01/18/21). Staff also stated that on Friday, Jan 15th,2021, they had informed the family that the patient was rapidly detiorating. Staff also stated that the family knowingly gave the consent to vaccinate her. She also stated that the hospice Nurse believes that the death was primarily caused by her detiorating state. She also stated that the hospice Nurse informed that the death was not due to the Vaccine. Per Lead Pharmacist at the clinic.

Patient is a 90-year-old female. She is a nursing home resident with and ongoing COVID 19 outbreak occurring . She has been diagnosed with corona virus on 1/4/21. She apparently has not eaten or drank anything in about a week. She was being hydrated at the nursing home with normal saline, but has failed to

No prior vaccinations for this event.

improve. She was sent to the ER and was admitted on 1/8/21 to hospital At no time during the hospital stay has she been more than minimal responsive. She need O2 for Comfort but on CXR and CT cardiopulmonary imagining was clear. Discharge note stated that he was requiring supplemental oxygen, but her chest x-ray on admission actually showed no acute cardiopulmonary disease. She was diagnosed with COVID-19 on 1/4/21. Most likely, this disease set her level of function back to the point that she was no longer eating and drinking, and she just overall rapidly declined after that. There was no evidence of an actual COVID pneumonia or pneumonitis. On 1/12/2021 family made patient a DNR and IVF were stopped and switched to comforted care. Patient expired 1/13/21

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was was brought to the ED from facility which he received the vaccine via ambulance with BiPAP, hypoxia, and one dose of Epi of 0.3 mg. He then required intubation, and had struggled with hypoxia, even on increasing PEEP. CODE BLUE called in the ED for PEA. He was medicated for such (please see the code run sheet for details), and he came in and out of the code 5 times. After 95 minutes, with the wife at the bedside, and family conference by phone, the code was called, and he was pronounced at 18:20. He received in total 8 me of Epi, 3 shots of Atropine, 3 amps bicarb. He got lasix 40 mg, lovenox 60 mg subcutaneous once. He had a CVC into the right internal jugular, and levophed was started, then Epinephrine drip was started. Prior to the code he got steroids (solumedrol 125 mg, then later decadron 6 mg iv), benadryl iv, antibiotics (ceftraixone / zithromax), and lasix 40 mg. All this time while in the ED, the Rt was at the bedside, and lots of secretions from the lungs were aspirated, bloody color. á Code was the result of PEA secondary to hypoxia (

"shortness of breath, chest xray with pulmonary edema, periorbital edema Narrative: 73 yo M w/ PMH HTN, HLD, EVAR (2013) for AAA c/b persistent type II endoleak s/p multilple repairs (2015 & 2017) c/b glue embolization down into the R CIA secured with additional stent placement with the R iliac limb, s/p b/l Iliac artery aneurysm stent 08/31/20, and PTSD. Former smoker, quit 12+ yrs ago. 11/1/20-11/6/20: Hospitalized for acute on chronic back pain, found to multiple hypermetabolic lesions in the axial skeleton. Diagnosed with epithelioid angiosarcoma. Patient discharged to facility. 12/17/20: Patient received his 1st COVID-19 vaccine w/o complications at facility. 12/21/20: Underwent cyberknife treatment. 12/31/20: Transferred from facility to ER for new O2 requirement, SOB, cough, chest X ray / pulm edema, tachycardic and new periorbital edema. 12/31/20: Admitted to ICU before transfer to acute care. 1/1/21: Pulmonary consult, ""Labs are notable for progressive left shift with bandemia, markedly elevated inflammatory markers (D-dimer, ESR, CRP, ferritin, LDH), mild elevation in procalcitonin, mild elevation in lactate that has improved, and negative viral panel including COVID-19 x2. CT chest is notable for b/l GGOs along with some interstitial infiltrates with an upper and particularly mid zone and perihilar predominance, septal thickening and crazy paving, and numerous cystic lesions or pneumatoceles. There is a lack of lobar consolidation and pulmonary nodules. Of note, PET/CT about 2 months ago only demonstrated some mild to moderate emphysema mostly in the upper lobes. Therefore, there has been a relatively dramatic change in a few months, suggesting a more subacute process, rather than an acute infectious process such as a viral pneumonia, including COVID-19 infection, in which the GGOs tend to be subpleural and peripheral. Overall, our suspicion for COVID-19 is relatively low, with negative testing x2 yesterday, negative testing a few weeks ago, and lack of sick contacts, but it is possible. Therefore, higher on the differential is a more subacute infection or chemotherapy-induced pneumonitis. Risk factors include malignancy, chemotherapy, and use of steroids (equivalence of about 27 mg of Prednisone in the form of Dexamethasone since 11/6/20 without PJP prophylaxis). These risk factors, along with consistent imaging and elevated LDH, make PJP quite likely. Fungal infection is less likely based on imaging. Chemotherapy-induced pneumonitis is a possibility, especially given the more subacute picture based on imaging. Both Gemcitabine and Docetaxel can cause pneumonitis. However, the patient has been on steroids, which is used to treat drug-induced pneumonitis, although this does not exclude it completely."" 1/2/21: Transferred to ICU for worsening hypoxemia as patient reached 40L/100% FIO2 and remained on COVID isolation/COVID patient under	No prior vaccinations for this event.

investigation per ID recommendation. 1/4/21: Isolation precautions discontinued due to lower suspicion for active COVID infection to explain current presentation 1/6/21: Went into atrial fibrillation w/o RVR overnight 1/6. Tolerating, with MAPs in low 60s and HR in high 90s/low 100s. Suspect due to being-1L yesterday from diuresis, lasix stopped. S/p amiodarone bolus + drip, albumin 5% bolus 1/5/21: Macrocytic anemia NOS w/ slowly worsening H/H s/p PRBC x 1 unit 1/7/21: Per ICU Life-sustaining treatment note, ""Following discussion w/ patient that his lung dx has been refractory to txt and hasn't improved despite maximal therapy, patient agreed to transition to hospice after he settles affairs. "" 1/7/21 Infectious Disease note: ""This is an immunocompromised host due to cancer on active chemotherapy (albeit ANC>4000 on admission) and notably had been on daily PO dexamethasone 1 mg TID (total daily dose 3 mg, equivalent to 20 mg PO prednisone) since 11/6/20 without any PJP ppx. There was elevated c/f COVID-19 infection in setting of patient's presenting symptoms, especially in conjunction with b/l GGOs on imaging. Has undergone multiple COVID test that have all resulted negative. Discussed radiographic findings with radiology colleagues, and overall, it is difficult to definitively narrow the differential with imaging alone, but overall density of GGOs seem to appear less likely PJP and more in line with chemical pneumonitis vs COVID, although less typical for viral pneumonia as well. Given false-negative COVID tests are not unheard of, especially in the immunocompromised population, patient was kept on isolation precautions as a PUI for abundance of caution. He is now off precautions. In setting of patient having been on prednisone for some time without PJP ppx, he was also started on treatment dose TMP/SMX. Beta-d-glucan has returned positive, and although not the ideal test for PJP, this can certainly support a potential dx of PJP. Unfortunately, DFA from sputum was not performed due to insufficient sample and currently the patient is unable to produce an additional sample for testing. He is tolerating the high-dose TMP/SMX; we adjusted the dose to three SS tablets TID based on his somewhat declining UOP. Other fungal etiologies are pending work-up as well. Lastly, patient's chemotherapy is known to cause pneumonitis, but per pulmonology team, he receives prophylactic dexamethasone with his chemo cycles that should help to prevent drug-induced pneumonitis. Remains on the differential for now and this should also be concurrently treated with the steroids he is receiving."" 1/10/21: Comfort care initiated. All non-comfort measures were discontinued. Time of death: Jan 10,2021@14:56; immediate cause of death per death note is ""hypoxic respiratory

failure"""

Resident was vaccinated on 12/31/20. Then on 1/14/21 he tested positive for SARS-CoV-2 on routine surveillance PCR testing. Another resident on the same hall was COVID positive on 1/11/21. Results of the PCR test were obtained on 1/16/21. He appeared asymptomatic at that time. Given his COVID positive status, all aerosol generating procedures had to be stopped. Overnight on 1/16/21 into 1/17/21, he had the

No prior vaccinations for this event.

onset of acute respiratory failure and was transported to the hospital. Per notes, he was put on BiPAP for several hours, but his CO2 level did not improve. Per prior advance directives completed with the resident and his two brothers, he had DNR/DNI orders. The hospital physician spoke with his brother and the decision was made to move to comfort care. He was discharged to inpatient hospice and died around 4pm on 1/18/21. This outcome does not appear to be vaccine-related, but death from COVID-19 infection is listed as a reportable event following COVID-19 vaccination.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received vaccine uneventfully with no acute concerns. Left clinic and by report went out with friends. Spoke to father on phone at or around 9:00 pm. Failed to show up to work and was found dead at home. Other details pending

After being observed for approximately 20 minutes and patient walked to her car without assistance I was called to assess the patient in the parking lot for troubles breathing. EMS was called as I made my way outside. Upon my arrival patient was leaning out of the car and stating that she could not breath. She was able to tell me that she was allergic to penicillin. Oxygen was immediately placed on the patient with minimal relief. Lung sounds were coarse throughout. She then began to vomit about every 20-30 seconds. Epipen was administered in the right leg with no relief. Patient continued to complain of troubles breathing and vomiting. A second epipen was administered in the patients right arm again with no relief. A few minutes later patient was given racemic epinephrine through the oxygen mask. There appeared to be mild improvement in her breathing as she appeared more comfortable, but still complaining of shortness of breath and vomiting. When EMS arrived patient was unable to transport herself to the stretcher. When EMS and clinical staff transferred patient to the stretcher she became unresponsive. She appeared to still be breathing. She did not respond to verbal stimuli. Per ED report large amount of fluid was suctioned from the patients lungs following intubation in the ambulance. When patient arrived to the ED she was extubated and re-intubated without difficulty and further fluid was suctioned. At that time patient was found to be in PEA, shock was delivered. Shortly thereafter no cardiac activity was found and patient pronounced dead.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Heart stopped; Could not swallow; This is a spontaneous report from a contactable nurse (patient's wife). An 85-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 21Jan2021 at a single dose for COVID-19 immunization. Medical history included blood pressure abnormal (verbatim: blood pressure) from an unknown date and unknown if ongoing, neuropathy from an unknown date and unknown if ongoing, weight issue from an unknown date and unknown if ongoing, diabetes from an unknown date and unknown if ongoing, walker user from an unknown date and unknown if ongoing. Concomitant medications included insulin aspart (NOVOLOG) taken for diabetes from an unspecified date to an unspecified date; and he was taking a long acting one as well. The patient previously received the influenza vaccine (MANUFACTURER UNKNOWN) for immunization on unknown dates (""had flu shots before with no reactions and everything,		No prior vaccinations for this event.

nothing before""). On 24Jan2021, the patient's heart stopped (death, medically significant), and could not swallow (medically significant). The clinical course was reported as follows: The patient's wife stated the patient was taking insulin aspart (NOVOLOG) and he was taking a long acting one as well. The reporter, the patient's wife and a retired registered nurse (RN) stated, her husband (patient) just died and she thought he died from the COVID vaccine (later clarified the reason of death was-heart stopped). The patient had the vaccine on 21Jan2021, which was on a Thursday, and he was fine. On the following Sunday around 1:30 (on 24Jan2021), the patient was feeling a little weak, however, the patient's wife thought maybe his blood sugar was low. The patient's wife checked, and the patient's blood sugar was 91. The patient's wife went to get some yogurt to feed him in order to get his blood sugar up a little; ""which was a normal thing for him, it was not that low for him."" Then, suddenly, the patient fell, and the patient's wife could not get a pulse or anything. The patient's wife called an unspecified number and she started compressions; however, he was dead. The patient's wife stated the patient just had his heart test, a three hour long one, and it was ""perfect three weeks ago."" The patient had just gone to the doctor the other day and his blood pressure was ""fine and everything."" The patient's wife stated that other than his diabetes, ""which he had for (sentence incomplete)."" Regarding lab tests, the patient's wife stated, ""No, he had it before but not in the last two weeks. He was going for one because we just went to the doctor last week and he was going to call yesterday to make the appointment request to get his blood work done. Blood work has been good except his A1C was always high, but other than that everything was good"" (as reported). Regarding causality, the patient's wife stated, ""I do, because he was fine until about half an hour before he died. He said to me, I feel a little weak today and then I was talking to him that your upper body strength is really good and then I said, we just have to work on your weight a little more because he did have neuropathy. And then, I went out of the room and all of a sudden I just heard him fall and that is when I just went in to check his blood sugar and it was 91 and I got him yogurt and he started eating that and then that was it, he started spitting it out and he said, I could not swallow and that was it, he just died."" The patient's wife further added, ""I just wanted other people to know that things like this happen and I am sure it was from that because he was healthy as could be. He was walking with his walker, the day before outside and he felt fine."" The clinical outcome of the event, heart stopped, was fatal. The clinical outcome of the event, could not swallow, was unknown. The patient died on 24Jan2021 due to ""heart stopped."" An autopsy was not performed. The

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
passed away; cough; This is a spontaneous report from a contactable consumer, the patient's daughter. A 92-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration in the left arm on 13Jan2021 at 11:00 (at the age of 92-years-old) as a single dose for COVID-19 immunization. Ongoing medical history included nursing home resident, admitted to hospice on 13Jan2021 (prior to vaccination), and oxygen supplementation (due to low oxygen levels) from a few days prior to the vaccine (Jan2021). Other relevant medical history included congestive heart failure from Dec2020 and sulfa allergy. Prior to the vaccination, the patient was tested numerous times (as reported) for COVID-19 and was negative. There were no concomitant medications. The patient did not receive any other vaccines within four weeks prior to the vaccination. A few days before the vaccination, her oxygen level had gone down, and she had been placed on oxygen. Prior to receiving the vaccine, the patient was reported as being 'fine'. On 13Jan2021, the patient received the vaccine at 11:00. The patient coughed maybe 5 or 6 times and then dropped her head. Resuscitation was not performed as patient had a do not resuscitate (DNR) order. The patient passed away on 13Jan2021 at 13:05. The cause of death was not reported. An autopsy was not performed. The clinical outcome of the cough was unknown at the time of death. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Reported Cause(s) of Death: passed away		No prior vaccinations for this event.

Pt stated that she developed a dry hacking cough 2 days prior to the vaccine on 1/7/21. Over the last few days prior to admission, she developed generalized weakness, SOB, loss of sense of taste and smell w/ associated decreased appetite and nausea ultimately SOB in the24 hours prior to admission. Final Diagnosis- acute hypoxic respiratory failure secondary to COVID-19 pneumonia. Pt died on 2/3/21. See Medical report for more information.	No prior vaccinations for this event.

DEATH	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
death Narrative: Pt attended arthritis clinic appt 0900; labs shortly after; rec'd vaccine in clinic ~ 1113; seen on surveillance camera walking to parking garage ~ 1145; medical center rec'd call from wife ~ 1900 that pt never returned home; police found vehicle running in parking garage, code called, pt obviously deceased by that time 1930, body sent to medical examiner for autopsy.	No prior vaccinations for this event.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident received vaccination at 9:12 am, she was monitored and checked at the 15 minute interval 9:27 am, reassessed, vitals were fine. Within 20 (9:32 am) minutes of receiving the vaccine she was unresponsive, pupils were fixed at 9:45 am, no vital signs noted; hospice came out and reported her time of death 10:21 am. This person was on hospice.		No prior vaccinations for this event.
	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient's primary care provider received a death certificate to be signed for this patient. He spoke with the patient's husband and son, who reported that the patient had pain and swelling at the vaccine administration site after receiving the vaccine and was feeling unwell after receiving the vaccine. The patient's family reported that they found her unresponsive on 2/2/21 and called 9-1-1. The patient was pronounced dead upon arrival of emergency responders.		No prior vaccinations for this event.
	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Began with vomiting and diarrhea. C/O chest pain. Bradycardia. Hypotension. 2 seizures in 45 minutes after not having one in years. We gave fluids. Gave Zofran. Comfort measures. Pt passed at midnight. Was completely fine one day before. Had minimal issues with COVID though did have a pneumonia that was treated w ATB early on and resolved.		No prior vaccinations for this event.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Possible transverse myelitis developing 2 days after vaccine injection. Death on day 9 after vaccination		No prior vaccinations for this event.
	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My father was in weak condition to begin with. He didn't get out of bed for the next few days after receiving the vaccine. The little amount that he ate was consumed in bed. He began aspirating his food which lead to pneumonia. He wasn't strong enough to fight off the pneumonia even with antibiotics. He died on 1/23/21. While he might have passed soon in any case, I believe that the vaccine may possibly have increased his weakness/exhaustion thereby hastening his demise.		No prior vaccinations for this event.
	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Patient expired. Per Emergency MD note: ""This is a 72-year-old male with what sounds like diabetes, atrial fibrillation, and hypertension who presents via EMS in cardiac arrest. It sounds like he received his Covid vaccine last week. Initially he had some mild effects from it. However over the last day or so he has felt very unwell. He apparently called his wife today and told her that he was not feeling well and so she returned home. Shortly thereafter he attempted to get up from his chair. He then collapsed and fell forward onto his face. Sounds like his wife had some difficulty rolling him over to perform CPR. When EMS arrived they found him in PEA. He received a total of 5 rounds of epinephrine. At some point they did have return of spontaneous circulation. However just prior to arriving in the emergency department they lost pulses		No prior vaccinations for this event.

again. The patient was intubated with an 8 oh endotracheal tube prior to arrival."""

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient tested positive for COVID-19 on 1/8/21. She demonstrated a decline in appetite and the ability to feed herself d/t this illness, but no respiratory or other symptoms. She received COVID-19 vaccine #2 on 1/26/21. She demonstrated an SDTI wound to the Lt. heel on 1/27/21. On 1/31/21 she was noted to have a significant weight loss. She was admitted to services on 2/1/21 with comfort care orders. On 2/2/21 she was observed to be without vital signs. Orders were for DNR, and CPR was not initiated in accordance with that order. She was pronounced dead at 0112 on 2/1/21.		No prior vaccinations for this event.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
death. No known symptoms or complaints. found unresponsive in bed. Released to funeral home as the Medical Examiner will not perform and autopsy. Dr. will sign the DC.		No prior vaccinations for this event.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"In discussion with Dr., medical director at Detox, she arrived night of 2/3/21 was quite intoxicated so was not going through any withdrawal. She was getting vitals and CIW checked regularly. First dose of chlordiazepoxide 25mg was 2/4 at 1:25pm for CIWA 9. She had repeat vitals at 5:50pm, CIWA 1, vitals: P 67, 118/79, 94% on RA, T 98.3. she had complained of some ""pressure in her head"" and feeling anxious, but otherwise denied other complaints. she was talking with others in the group, then other patients report she suddenly started having seizure like activity around 6:45pm, med techs came to help and found her		No prior vaccinations for this event.

stiff, gurgling. they tried to get vitals on her, called 911, noticed that at 6:54pm she had lost a pulse and they started CPR. paramedics arrived at 7:08pm and she was brought to ED. Pt BIBA in cardiac arrest. Pt was at Detox Center when she was reported to have seizure-like activity followed by collapse. She was found to be pulseless and CPR initiated by staff members. EMS arrived and performed approx 15 min of CPR and gave pt epi x 3 and bicarb. No shocks administered but they did not report a rhythm. In the emergency room the patient arrived and was found to be pulseless with PEA arrest, CPR was initiated, patient was intubated. ROSC ultimately achieved, patient remained very acidotic despite ventilator adjustment, head CT revealed cerebral edema. Pt also found to be profoundly anemic with a hemoglobin of 5 and platelets of 37, she was thought to be GI bleeding so medications for this were initiated. Patient then became more hypoxemic with bradycardia, consultation with neurosurgery and critical care medicine at tertiary care center deemed ongoing CPR futile. Patient arrested at 2:30AM on 2/5, pronounced dead at 2:48AM."

DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Pt had 2nd vaccine, went home and started having ""cramping"" in all of her muscles. It became bad enough that she was taken to local ED where she then started coughing up blood, required intubation and about 6 hrs later, died."	No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

My mom received the Covid 19 vaccine on Jan 5, 2021 and became very about a week later. I was informed that she tested positive for Covid 19 on January 14th. One January 17th she became very tired and weak and would not eat. Hospice called me and told me that she was in a decline state. I saw her on January 25 and 26 and she was just sleeping and could not open her eyes. Her vitals were good and she seemed to understand when I talked to her - she would squeeze my hand and moan but she could not talk or open her eyes. My mom passed away on January 27, 2021 just 22 days after receiving the Covid 19 vaccine. She was very think to begin with and being to weak and tired to eat resulted in her losing even more weight. Some of the other residents were given fluids to help and they recovered. My mom was not given fluids. I believe there were 20 deaths in her care home for the month of January when they vaccinated. This was an alarming number of deaths for the home. The facility had very few Covid deaths in 2019 and 2020. I asked every week if they had any Covid and or Covid deaths and this amount was shocking to me and the workers there. No prior vaccinations for this event.

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Narrative: Patient with history advanced vascular dementia, hypertensive cerebrovascular disease and stroke, T2DM. Received her second dose of Pfizer COVID-19 vaccine at approximately 14:00 and was reported to have expired at home at 20:55. Dr. (Medical Director) spoke with patient's son/caregiver 2/4/21. Son reports that patient was in her usual health yesterday morning, deemed well enough by son to travel for vaccination. He reports she had no bothersome symptoms after either first or second vaccinations. Specifically denied rash, wheeze, and difficulty breathing. Son was with patient throughout the day. In the evening, when preparing for bed, he noted she became suddenly unresponsive in a similar fashion as she has done several times in past years. While in all previous such episodes she recovered within minutes, last evening she did not regain consciousness, experiences a brief period of labored breathing, and died. Patient's son called 911 and the patient's body was brought to the medical examiners. The medical examiner declined to proceed with autopsy. Patient's son is not interested in autopsy. Patient's son reports confidence that his mother's underlying hypertensive/diabetic cardiovascular disease is the natural cause of

her death. Other Relevant Hx: Symptoms: & Death Treatment:

DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
"Narrative: See ""Other Relevant History"" in Section 6 above Other Relevant Hx: 76yo man with a history of for C5 tetraplegia 2/2 cervical stenosis leading to neurogenic bowel/bladder (chronic suprapubic catheter) and chronic respiratory failure with tracheostomy, severe dysphagia s/p G tube placement and multiple aspiration pneumonias, COPD GOLD III, hx MRSA bacteremia (7/2018) and E coli bacteremia (12/2019). Patient transferred from Spinal Cord Injury until to ICU on 1/11/2021 due to worsneing dyspnea, hypoxia (80s) and tachycardia and was found to have acute hypoxic respiratory failure likely 2/2 multifocal pneumonia. CXR findings of ""There is interval increase in patchy airspace infiltrates and consolidation in bilateral lungs concerning for pneumonia"" Patient was started on vancomycin and pip/tazo on 1/11 and tracheal aspirate cultures were obtained for VAP diagnosis which ultimately grew Serratia liquifaciens and Proteus mirabilis. Infectious Diseases was consulted who recommended a switch to ertapenem therapy for a total 10 day course for VAP. UCx/BCx remained negative. On 1/20, a therapeutic bronchoscopy was completed with cultures growing Stenotrophomonas maltophilia and pan-S Klebsiella pneumoniae. The following day a chest tube was inserted and the course of ertapenem completed but vancomycin was continued. By 1/22, patient developed shock liver with ALT/AST 2135/1579 from normal range the day prior and SCr increased to 1.3 from baseline 0.7/cystatin C of 2.46 up from 1.15. Levofloxacin was added for Stenotrophomonas coverage. By 1/25, patient's clinical status continued to decline and Cardiology was consulted for new onset Afib with RVR. Discussion was documented with patient's family who requested DNR. Patient passed away in the early AM on 1/26. Demise does not appear to be related to COVID-19 vaccination but occurred in recent timeframe. Symptoms: ElevatedLiverEnzymes & death, pneumonia, afib"	No prior vaccinations for this event.

Xrays showed covid Poss pockets all in her lungs on 15Jan; Xrays showed covid Poss pockets all in her lungs on 15Jan; This is a spontaneous report from a contactable consumer. An 85-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at single dose for covid-19 immunisation. Medical history included dementia. Concomitant medications were not reported. Patient popped hot 02Jan2021 along with 4 others on the hall she lived. Within 9 days 50+ patients were positive. All had the vaccine the same day. Patient was test positive on 02Jan2021. She was on day 12 of her quarantine when she started to get worse. She was unresponsive by		No prior vaccinations for this event.

16Jan2021 and passed 18Jan2021. We were with her from 14Jan2021 to 18Jan2021. But had not been allowed to visit with her since Mar2020. And what post treatment pairs well with it? Publicly we hear Remdesivir and Bamlanivimab but these patients only received a general antibiotic and some vitamins. Death cause was Xrays showed covid Poss pockets all in her lungs on 15Jan2021. No autopsy was performed. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information; Reported Cause(s) of Death: Xrays showed covid Poss pockets all in her lungs on 15Jan

DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
bowel perforation; pain in her upper abdomen; This is a spontaneous report from a contactable consumer. An 86-year-old female patient received the 2nd dose of bnt162b2 (BNT162B2) at single dose on 13Jan2021 for Covid-19 immunisation, administerd at nursing home/senior living facility Medical history included dementia, arthritis. No known allergies. Patient was not pregnant. Patient had not COVID prior vaccination. Concomitant medication in 2 weeks included: memantine (manufacturer unknown) 10 mg BID, diclofenac (manufacturer unknown) BID, carbidopa, levodopa (manufacturer unknown) 25-100 mg TID, quetiapine (manufacturer unknown) 12.5 mg q HS, escitalopram oxalate (LEXAPRO) 10 mg q HS, paracetamol (TYLENOL) 650 mg BID, glucosamine (manufacturer unknown) drink. The patient received the 1st dose of bnt162b2 (BNT162B2) at single dose on 24Dec2020 for Covid-19 immunisation. No other vaccine received in 4 weeks. The patient experienced bowel perforation and pain in her upper abdomen on 18Jan2021 07:30. The events resulted in Emergency room/department or urgent care, Life threatening illness (immediate risk of death from the event), and death. On 18Jan2021 07:30 AM, less than a week	No prior vaccinations for this event.

after the second shot, she had pain in her upper abdomen and was taken to the ER on 18Jan2021. CT showed a bowel perforation in the small bowel. She had never had bowel surgery or diverticulitis. She had been healthy other than her dementia and arthritis. Patient received treatment for the events: hospice and pain management. COVID-19 was not tested post vaccination. The cause of death was bowel perforation. An autopsy was not performed. Information about lot/batch number has been requested.; Reported Cause(s) of Death: bowel perforation

DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Resident was weak, fatigued and had a fever of 101. F the following morning after receiving the 2nd dose of vaccine. Later in the day she was feeling better and vital signs were WNL. The next morning, she was found unresponsive and pronounced dead by paramedics.	No prior vaccinations for this event.
DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
her arm was sore but no other adverse reactions until Saturday, Feburary 6th 2021 she had stroke between 4 and 6pm. She died within 6 to 7 hours later.	No prior vaccinations for this event.
DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
My mom only had site soreness after her covid vaccine on 1/21 which resolved within a couple days. However, she died in the early morning hours of 1/25, she was fine the day before, no sign of injury. We found her collapsed on the ground and although we tried cpr she was already dead. She had gone to the hospital on 12/28 for shortness of breath, angina and symptomatic anemia, her ekg was unchanged and	No prior vaccinations for this event.

blood work normal except for anemia. The cardiologist did not think a cardiac cath was needed. Her shortness of breath improved with a blood transfusion and a dose of lasix (no heart failure).

DEATH **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Patient received 2nd dose of Pfizer vaccine on 2/2/21 and on 2/6/21 he died in his sleep in the a.m. No other signs or symptoms were observed prior to death. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Resident coughing in dining room, staff suctioned, physician stated to transfer via 911 to hospital, 6:33 PM. Hospital notified Nursing Home staff resident passed away at 8:25 PM. No adverse reaction noted to the Covid vaccine 24 hours after each dose at Nursing Home. There was no airway obstruction, cardiorespiratory arrest, death was natural at hospital. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Resident expired 01/26/21 at 5:25am. No prior vaccinations for this event.

DEATH **COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Individual collapsed 9 days post-vaccination with no known reason. Despite being healthy prior to vaccination, individual's condition deteriorated rapidly. Individual passed away on 1-17-2021. No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Resident passed away 2 days after receiving the vaccine. oxygen level has decreased shortly 1 day after receiving the vaccine.

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient received the vaccine on 1/26/2021 and per employee at facility patient passed away on 2/01/2021.

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Day after receiving the vaccine, the patient complained of abdominal pain which worsened over the day. She went to the ED and was hospitalized. Abdominal pain complaints increased and continued, she decompensated rapidly, was intubated and subsequently died 3 days later. Imaging results showed, progressive ovarian cancer in the bowels. Blood culture revealed that she had E.Coli in her blood. It is thought that this is NOT related to the vaccine.

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Dr. received an urgent request to call a local Justice of the peace regarding one of her patients who was found dead in her home today. At this time no foul play is suspected. Dr. said the patient was relatively healthy with no major issues other than some hypertension

No prior vaccinations for this event.

"Patient received her first covid vaccine on 1/27/21. on 1/30/21 she presented to the emergency department complaining of nausea, she had a negative work up, felt better and was sent home. on 2/5/21 she returned to the emergency department more ill-appearing and complaining of ""feeling sick"". she had fatigue, chills, decrease in activity level. her work up at this visit revealed multiple metabolic abnormalities, No prior vaccinations for this event.

sepsis and bacteremia. She ultimately passed away at this visit with at cause of death listed as acute liver failure, pneumonia, and DIC>"

DEATH	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
2/2/2021- seen in Ed with c/o intermittent fever following 2nd dose. Redness to bilateral upper extremities, c/o some pain with urination, weak. V/S stable, afebrile in ED. Assess for infection. No significant abnormal labs (see below), hydrated and discharged. 2/4/2021- arrived in ED with c/o vomiting, seen earlier by PCP that day labs drawn. Shortly after arriving in the ED copious amouts of emesis noted, the patient went into full cardiac arrest and CPR was started. -Please see HPI above, in addition after intubation the patient coded again. More epinephrine and lidocaine were given. CPR was resumed. We did obtain ROSC and targeted temperature management was pursued. He is placed on a lidocaine drip and a right femoral central line was placed by myself. At this time, norepinephrine drip was initiated given his continued hypotension. Post intubation chest x-ray suggests possible abdominal pathology and once the patient was stabilized further, he was sent to the CT scanner where CT head without IV contrast and CT chest, abdomen and pelvis with IV contrast was obtained. He did lose pulses once in the radiology suite. This was brief. IV fluids were initiated and he received over 2 L of crystalloid therapy. He continued to be hypotensive in the emergency department and vasopressin was added. He also had a single dose of Neo-Synephrine and IV push fashion to help bring his blood pressure up. CT scan reveals probable bilateral aspiration pneumonia/pneumonitis and dilated loops of small bowel without a transition point and pneumatosis involving loops in the left upper quadrant. I did try to initiate consult with critical care and possible transfer, however he continued to be unstable and coded requiring CPR multiple times. He was given IV bicarbonate given his prolonged CPR state and pH. Ultimately, the family decided to make the patient comfort measures only given his critical illness. Shortly after making this decision he did pass away in the emergency department. RADIOLOGY DIAGNOSTIC - CHEST PORTABLE 02/04 2051 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2059 IMPRESSION: 1. Findings highly suspicious for portal venous gas	No prior vaccinations for this event.

which can be seen in the setting of bowel ischemia. Consider CT for further evaluation and/or surgical consultation. 2. Endotracheal tube 3.7 cm above the carina. 3. Low lung volumes with mild patchy perihilar opacities. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 8:55 PM Impression By: MD CT SCAN - CT HEAD WO 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2200 IMPRESSION: Negative for acute intracranial process. No evidence of mass effect, acute hemorrhage or definite acute cortical infarct. Final Report Signed by: M.D., Sign Date/Time: 02/04/2021 9:57 PM Impression By: - MD CT SCAN - CT CHEST/ABD/PELVIS W 02/04 2140 *** Report Impression - Status: SIGNED Entered: 02/04/2021 2214 IMPRESSION: 1. Ill-defined patchy opacities within the bilateral upper lobes, right middle lobe, in consolidative opacities within bilateral lower lobes which could represent aspiration, and/or multifocal pneumonia. 2. Small right trace left pleural effusions. 3. Diffusely dilated small bowel without a transition point and mucosal hyperenhancement involving the colon with areas of pneumatosis involving loops of small bowel within the left upper quadrant and portal venous air consistent with hypoperfusion complex. There is a small caliber appearance of the aorta and a flattened appearance of the IVC is well. 4. Intravascular air within the IVC and bilateral iliac veins could be secondary to right femoral central lying injection. 5. Somewhat abnormal enhancement pattern of the kidneys with hypoenhancement of the medullary pyramids which may suggest hypoperfusion injury as well. 6. Probable nondisplaced rib fractures on the right at ribs 2 through

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Client was administered the vaccine while symptomatic (01/25/21) although client did not know he was symptomatic for COVID-19. He had been exposed to a family member who had tested positive and should have been in quarantine but wasn't either because it was not felt he was considered a close contact by his family opinion or his family member never notified public health of this close contact...?. Clinet had presented to the ED following day after vaccination for shortness of breath and fatigue and an antigen test showed he was positive for COVID-19. He was sent home that same day 01/26/21. He was back in ED on

No prior vaccinations for this event.

01/28/21 for worsening symptoms and admitted to hospital and later placed on ventilator. He passed away on 02/09/2021 (date of death was per his wife).

DEATH	COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)
"anxious, restless, weak, dizzy, felt ""horrible"". Continued to C/O symptoms,. At 01:15, patient lost consciousness , then stopped breathing and lost pulse. Narrative: Patient was first vaccinated for COVID 19 on 1/8/21. On 1/24/21: 61 year old presents to E.R. with CC of chest pain/sob, with multiple medical conditions including hypertension, atrial fibrillation on apixaban, cardiomyopathy with poor EF, dyslipidemia, COPD, CVA, lung CA s/p radiotherapy, PTSD, depression, Churg Strauss Syndrome, Sjogren's syndrome presented with chief complaint of chest pain or shortness of breath. He has been having worsening shortness of breath the past few days, also complains of cough productive of yellowish sputum, no hemoptysis. He complains of left upper chest pain with no radiation. There is no diaphoresis, palpitations or lightheadedness. He denies fever or chills. He complains of having fallen a few times recently, thus he passed out. Could not say if there were seizures activity. Admitted to 3D Tele. On 1/27, Pt advises he had episode of substernal CP this am. RN advises pt was in afib w/ RVR at a rate >140 at time of CP. Pt CP improved w/ prn NTG. Pt HR improved after daily medications. Pt sts his CP has resolved. Pt admits to continued dyspnea. Increased trop, transferred. 1/28, struggling with orthopnea and cough. He has no peripheral edema. He does have intermittent chest pain. Patient having periods of A-Fib RVR with non-sustained rates of 140's-150's 1/29 more chest pain at 04:00, relieved with NTG. HR = AF, with RVR 145. At about 08:00, Cardiology sees patient and signs off, ""shortness of breath and cough not due to heart failure as evidenced by orthostatic hypotension and no improvement in symptoms with diuresis. Consider underlying lung disease vs acute pulmonary disease."" No pulmonary consult noted. 1/29 Patient received 2nd dose COVID19 vaccine at about 3:30-4p. No notes from staff on this event. No notes from MD that this was discussed and still part of the plan. 1/29 nurse's note: At around 2240 Pt was able to rest briefly but is now restless and anxious again. Tachypneic, stating he feels so weak and dizzy and overall just feel	No prior vaccinations for this event.

horrible. Continuing to get up frequently to have small soft bowel movements with assistance. Pt also stated ever since he got ""that shot"" he hasn't felt well. When asked what shot pt replied ""COVID shot."" Pt did receive 2nd dose of COVID vaccine 1/29 at 1530. Around 2250 Spoke w MOD to relay above information and overall concern for pt, asked for MOD to come to bedside to evaluate pt. MOD states he's handing off to oncoming MOD and they will come to bedside to see pt. Around 2300 oncoming MOD called and all above and previous information discussed Around 2310 MOD came to bedside to see pt. Will continue to monitor closely. 01/30/2021 ADDENDUM Around 0115 pt called for help to use bedside commode to urinate and have BM. Assisted x2 to BSC. While sitting on BSC pt's eyes rolled back and pt made postures consistent with a seizure, body became very rigid. Pt was unresponsive still with pulse. Lifted patient back to bed with 3 staff assist. Pt stopped breathing and lost pulse. Chest compressions started immediately and Code Blue called at 0120. 1/30 Hospitalist note: Called for CODE BLUE AGAIN AT 4:53. While on Vent after s/p Code blue for reasons not clear patient went into Asystole and code called second time. Patient had a prolonged CPR and was actually called off at 5:17 but he started having pulse and agonal resp. he was placed on Levophed and D5NS. He got a total of 9 amps of epi, 3 amps od Bicarb and 1amp of D50. Trope bumped from 0.12 to 0.43 prior to this he already was on ASA, Apixiban for afib. Cards are on board for his CHF for his pulmonary edema Lasix ordered. Hid lactic acid is elevated. Blood cultures pending. Started Zosyn and is on Levophed. Continue to monitor. Updated patients Mom and she requested to do everything at this point. Coded again at 5:40, survived, but AOD writes a death note(?) Coded for the 4th time at 08:18. Family at beside, Mother asks for code to be stopped."

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Few minutes post vaccination, after moving to observation area via wheelchair, the patient complained of dizziness. She took glucose tabs she had brought with her. Staff wheeled her to Triage # 1. Her eyes rolled back in her head and she lost consciousness. Staff (paramedics on site) transferred her to gurney and started compressions. AED placed, V- Fib was rhythm, Shock # 1 given, CPR resumed. Shocked again. Fire truck and additional EMT arrived on site and took over care. Epinephrine was given 3 times via intra-osseous route, Amiodarone given intra-osseous route. Additional defibrillation with on site AED for a total of 6-7 times. Patient had good chest rise with ambu-bag, no airway obstruction or peri-oral edema noted. Code called at 12:40 PM.		No prior vaccinations for this event.
	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**

Adverse reaction to the vaccine started with variable weakness beginning 1/29/2021. On 1/30/21 around 8:30pm, he needed assistance in the bathroom related to weakness and had what was later identified as a stroke with left side weakness and slurred speech. In accordance with his wishes, he had care at home. Due to his advanced age and frailty, a CT scan was not pursued. The 325 mg of aspirin that he was previously taking daily was discontinued. After the stroke, he needed total care. Hospice was established at home. Nursing assistant care was delivered by daughter. Death followed 9 days later (2/9/2021).

No prior vaccinations for this event.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Resident was given the Pfizer vaccine on January 22, 2021, nausea and shortness of breath was taken to the Hospital on the 23rd of January and passed on the 24, 2021

No prior vaccinations for this event.

started CPR. took him to ER Resuscitated briefly but went into CardioPulm Arrest again and PEA Resucitaion for aprox 1 hour but was unsuccessful. Noted to have Left leg more swollen than Right by 3 to 4 CM presumed to have died from massive Pulmonary embolism and inferior wall myocardial ischemia

this event.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient was found unresponsive on her kitchen floor about 9:45 AM on February 10, 2021 approximately 18 hours after receiving her first Covid-19 vaccination. Exact time of the event is unknown. She was known to get up between 6:30 and 7:30 AM. It appeared that she had not eaten breakfast nor taken any medication that morning. She was taken by ambulance to Medical Center where a CT scan showed an unrecoverable massive brain hemorrhage. She died at approximately 3:50 PM after the respirator was removed. She was sent to the local Medical Examiner afterwards.

No prior vaccinations for this event.

DEATH COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

She started having breathing problems/heart attack appearance. on 1/22/21 and went to the ER. Upon admittance was told it was an anaphylactic shock from the Covid shot. They kept her in ICU and released her 1/23/21. At 12:45 am on 1/24/21 she passed out and we called the ambulance. Hospital admitted her and worked through multiple organ failure issues and thought her numbers were under control. She was released on 1/27/21 and was driving on 1/28/21 around 4:15 pm and appears to have had heart failure and

had a wreck. She passed away that day.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
On December 17, 2020, my husband, received his first BioNTech BNT162b2 COVID-19 vaccination. On Thursday January 7, 2021, he received this second COVID-19 vaccination. The following three days after his second vaccination, he felt fine. The fourth day, on Sunday January 10, my husband felt extremely fatigued. On Monday the 11th and Tuesday the 12th, he worked a full shift but complained of extreme fatigue and extreme chills to the point that his teeth were chattering while on the phone with me. He decided to work through it. When he got home on Monday night, he started vomiting. On Wednesday January 13, he woke up and had swollen eyes. Once again, he felt extremely fatigued, even after a full nights rest. He had the day off but had an early meeting. After his meeting, he was still tired so he went back to sleep. I left to get lunch, and drop off our kids, and upon my return, I found him on the walk in closet floor, face up, having passed away. He felt as cold as ice. The rapid test done after they called the paramedics resulted in a negative COVID-19 test for him.		No prior vaccinations for this event.

	DEATH	**COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)**
Patient (now deceased) received 1st dose of Pfizer-BioNTech vaccine around December 21, 2020 and was noticed to be scratching, fatigued, and unresponsive by a family member on December 24, 2020. He received the second dose of the same vaccine around January 22, 2021. Pockmarks and bleeding scratch marks were noted by a family member on the patient's face prior to this second dose. On January 28, 2021 a family member was alerted that the patient was suffering from severe bullous pemphigoid- a skin condition that has never been experienced by the patient, has been reported to be related to COVID-19		No prior vaccinations for this event.

viral infection, and to T-cell responses promoted by vaccines. A corticosteroid was given, but did not work. Blisters developed to the point hands had to be dressed.

DEATH

COVID19 (COVID19 (PFIZER-BIONTECH)) (1200)

Patient had no energy in the first 24 hours and then began a steady decline that started with vomiting after 48 hours, then an inability to swallow and ultimately the patients death on 2/5/21.

No prior vaccinations for this event.
